JOB PERFORMANCE REPORT

RESEARCH PROJECT SEGMENT
(Inventory)

State: U T A H Project Title: Statewide Wildlife

Management Inventory

Project No.: W-65-R-40

Job Title: Statewide Upland Game

Job No.: A-4

Period Covered: October 1, 1991 to September 30, 1992

Abstract: This report includes upland game inventory and harvest data collected during 1991-92. Results of annual inventory and harvest surveys and long-term trends of indices derived by each method are included in the final report. Data obtained in 1992 are compared to 1991 and long-term averages.

Objectives:

1. Conduct efficient breeding and production surveys.
2. Determine annual harvest, hunters, hunter-days and success rates.
3. Inventory critical seasonal habitat.

Procedures:

Annual inventory procedures for ring-necked pheasants included winter sex ratio counts and summer roadside counts. The winter sex ratio counts were conducted from December 15, 1991 through February 10, 1992, as snow cover conditions allowed. Indices derived include hen-cock ratios and pheasants observed per 100 hours. Annual summer roadside counts (three or more per route) were conducted from July 22-August 22 on permanently established routes. Indices derived include pheasants per mile, young per mile, young per hen, mean brood and percent of hens with young.

Mourning dove breeding population trend was determined via the annual call count survey. This survey is part of a nationwide survey administered by the U. S. Fish and Wildlife Service. Call counts are conducted over 15 permanent, 20-mile routes. One count was made on each route between May 20-30.

Random brood counts were conducted on chukar and gray partridge, forest grouse (ruffed and blue), sage grouse, sharp-tailed grouse, wild turkey and quail from June 15-August 22. Indices derived for each species include mean brood size, young per 100 adults and birds observed per 100 hours of effort.

Sage grouse strutting ground counts and sharp-tailed grouse dancing ground counts were conducted from March 15-May 15. Total cocks counted, average cocks per ground and percent change from 1991 for comparable grounds were determined on a county basis.

The Gambel's quail long period waterhole counts were completed in July and August. Limited valley quail random brood counts were made in several counties.

Cottontail rabbit roadside counts were conducted over pre-established routes between July 15 and August 22. Indices derived include rabbits per mile and young per 100 adults.

Harvest questionnaires were mailed to determine the harvest of upland game birds, cottontail rabbit, and snowshoe hare. A sample of eligible licensees from the current year's (1992) resident small game license file and 1992 combination license file was used. The modified computerized pull-apart mailer was again used to obtain harvest data. Separate questionnaires were mailed to all band-tailed pigeon, white-tailed ptarmigan and wild turkey permittees. Indices derived include total hunters, hunter-days, total harvest and hunter success per day, plus success for each season.

The upland game questionnaires were processed by the Division of Wildlife Resources Information Systems Services Subsection. General upland game questionnaires as well as band-tailed pigeon, wild turkey and white-tailed ptarmigan questionnaires were analyzed by Game Management Section personnel.

Upland game hunters were checked at checking stations, and random field bag checks were made during each hunting season. Indices derived include bag per hunter (per day), bag per 100 hours, average hours per hunter-day and average hours per bird bagged. Additional sex and age composition data were compiled for some species using wing samples collected at checking stations.

Recommendations: This project should be continued for the purpose of determining trends of upland game populations and harvest statistics in Utah.

INTRODUCTION

The objective of Utah's upland game management program is to provide recreational hunting opportunity for sportsmen within the limits of the annual harvestable surplus for each species. It is based on the knowledge that populations of upland game experience relatively high rates of annual turnover. High reproductive rates are naturally compensated for by high death rates, whether hunting is allowed or not. Annual surveys are conducted to measure the production, trend and harvest of each upland game population hunted.

This is the twenty-second edition of this Annual Upland Game Report. It is an annual performance report of information compiled during inventory and harvest surveys conducted under Federal Aid Project W-65-R, Job A-4. Information contained herein was compiled by conservation officers, biologists, game managers and the upland game management staff of the Utah Division of Wildlife Resources.

This report serves as a handbook of inventory and harvest data. It is designed primarily for the use of those concerned with the management of upland game in Utah. A separate section is devoted to each species of upland game in Utah. Data are presented primarily in tabular form with limited narrative comment. The first page of each section provides a brief summary of population status and trend as indicated by inventory and harvest data.

During 1992, a total of 58,423 Utah sportsmen spent 431,497 days afield in pursuit of various upland game species (Table 1). The harvest of upland game totaled 472,018 animals. The proportion of the total upland game hunters which pursued each species is shown in Table 2 and the percentage failing to bag at least one bird (from general mail questionnaire) of each species in Table 3.

In 1992, Utah upland game hunters were required to purchase an Upland Game Habitat Stamp in order to pursue pheasants, mourning doves, chukar partridge, sage grouse, forest grouse, quail, Hungarian partridge, cottontail rabbit and snowshoe hare. Funds derived from the Upland Game Habitat Stamp will be used to purchase, develop and protect critical upland game habitat throughout Utah.

The regulations for 1992 upland game hunting seasons are shown in Appendix D.

GENERAL HARVEST QUESTIONNAIRE

Harvest statistics were obtained from a random sample of licensed hunters by their response to a hunter questionnaire. The combined upland game bird and rabbit-hare questionnaire was again used.

A total of 16,472 upland game questionnaires, a 15.50 percent sample, were mailed. Of the total, 827 (5.02%) questionnaires were undeliverable. Of the 15,645 questionnaires delivered, 5,977 (38.20%) useable upland game questionnaires were returned. Of those, 2,693 purchased a license but did not hunt upland game. By dividing the total of 106,223 eligible licensees by the usable returns (5,977), a projection factor of 17.771959 is derived.

The 1992 hunter questionnaire sample size increased from 1991, so a follow-up questionnaire was not sent to those who failed to return the first one. A high rate of return is desirable in order to obtain an adequate sample of harvest estimates in counties where hunting pressure and harvest are limited. Extremely small samples from these counties tend to over-estimate the harvest and thus bias the results. Although harvest, number of hunters and days-afield may be over-estimated where small samples are obtained, harvest per hunter-day should be relatively precise.

Table 1. Summary of harvest statistics from the general mail questionnaire for 1992.

Species	Hunters Afield	Total Harvest	Hunter-Days	Bag Per Hunter-Day	Bag Per Hunter	Bag Per Season
Pheasant	41,640	85,803	150,244	0.57	2.06

Total Hunter's**	81,119	71,259	68,174	70,142	67,017	64,868	61,922	58,423								

*Although wild turkey, sharp-tailed grouse, band-tailed pigeon and white-tailed ptarmigan harvest was determined by separate questionnaires, it is assumed that these hunters are derived from the same group of hunters who reported hunting other upland game bird species.

**This is not the total of the columns because many upland game hunters hunted more than one species.

AVERAGES (1961-91)	32		14		48		40		37		38		45								

The upland game questionnaire is designed to monitor statewide harvest trend from year to year. The more extensively a species is hunted, the more accurately the questionnaire measures the trend data. In an effort to improve the accuracy of indices for species which receive very little hunting pressure and harvest, and which have low densities and limited distribution, a unique questionnaire for that species is mailed to the permit holder. This method has been used for wild turkey, band-tailed pigeon, sharp-tailed grouse and white-tailed ptarmigan.

The annual harvest report is sometimes criticized for being inaccurate and without value. However, report users must recognize that the accuracy of the questionnaire is based on some basic assumptions. These assumptions are: (1) the returned useable sample is a completely random sample, (2) respondents recorded data correctly, i.e., they clearly understood the questionnaire, (3) respondents recorded data accurately, did not guess or lie, and (4) respondents correctly identified species hunted. If these assumptions are not met, projections of harvest by county may be over-estimated due to nonrespondent or memory biases. Extreme caution should be used in the interpretation of estimated harvest and hunters for specific species in specific counties. Rather, the long-term trend in these indices should be used in managing the populations.

Presently, the Upland Game Annual Report contains the best data available and therefore constitutes the basic facts of upland game management. Although this report has its limitations, the trend data is valuable in making professional judgments regarding upland game populations and harvest.

The annual report is used in wildlife planning. It can be used to establish relative importance among species and for developing new resources through transplants or habitat developments. It points out areas of needed research by indicating problems and possible causes. It documents population trends and it combines all this inventory information into one easily accessible publication. Thus it is used extensively by federal land management agencies in environmental impact statements and management plans. It will become increasingly more important in developing management plans and assessing impacts on wildlife habitat.

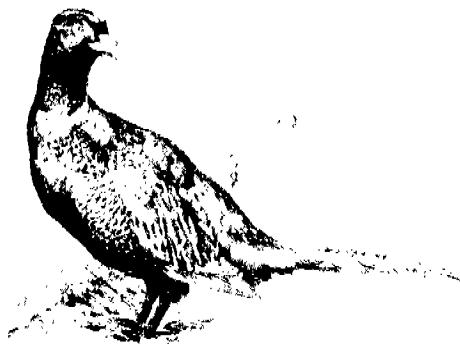

RING-NECKED PHEASANT

SUMMARY

The 1991-92 winter was relatively mild and survival of brood stock should have been good. Vegetation continues to return to inundated mud flats around the Great Salt Lake after the flooding of 1984. Aquatic vegetation such as cattails and bulrushes conducive to winter survival of pheasants is re-establishing noticeably.

Weather conditions during the nesting season were favorable in 1992. Statewide monthly average temperatures were at or above normal; average precipitation was above normal across several climatic subdivisions in May. Temperatures were at or above normal through the rest of the year and precipitation was scattered and sparse. Pheasants observed on roadside routes was above 1991 and more hens appeared to have young. Overall, production was up.

Harvest statistics compiled from the questionnaire indicated an increase in success compared to 1991. Harvest increased 18 percent from 1991, but remained 59 percent below the long-term average. Opening weekend success was up compared to the previous year based upon field bag check data and despite sporadic cold and rainy hunting conditions.

Winter Sex Ratio Counts

Results of the survey for the winter of 1991-92 and long-term trends are shown in Tables 1, 2 and Figure 1 of this section. Statewide comparisons to the winter of 1990-91 and the 10-year (1982-91) average are as follows:

	<u>Winter of 1991-92</u>	<u>Percent change from 1990-91</u>	<u>Average</u>
Total pheasants counted (roadside)	892	+6	-60
Hens per cock	2.15	-19	-38
Pheasants observed per 100 hours	1,293	-12	+2
Total hours effort. (roadside)	75	+27	-55

Winter sex ratio counts indicated a 12 percent decrease in pheasants observed per unit of effort. However, density estimates can be biased due to the non-random nature of the survey technique if effort is minimal. The hen-cock ratio decreased 19 percent from 1991 and was 38 percent below the long-term average. Slightly increased effort increased pheasant observations. However, no effort was expended in the Southern and Southeastern Regions.

Roadside Counts

A summary of summer roadside pheasant counts for 1992 is shown in Table 3. Long-term trends of pheasants per mile, young per mile, young per hen, percent of hens with young and mean brood size are found in Tables 4-8 and Figure 2. Summer 1992 survey results compared to 1991 and the previous 10-year (1982-91) average follow:

	<u>1992</u>	<u>Percent change from 1991</u>	<u>Average</u>
Total pheasants observed	1,212	+53	-32
Total miles driven	1,615	+3	-18
Pheasants per mile	0.75	+47	-14
Average brood size	3.93	-15	-23
Young per hen	3.40	-11	-13
Percent of hens with young	85	+8	+14

Temperatures throughout the state were above normal during February through June and precipitation was above normal during March and May. It appears that favorable weather conditions contributed to a 47 percent increase in pheasants observed per mile and an 8 percent increase in percent of hens with young.

Vegetation continues to re-establish on alkaline soils around the Great Salt Lake. This should increase both the quantity and quality of wintering, nesting and brood-rearing habitat in Box Elder, Salt Lake, Davis and Weber counties.

Harvest

Hunter Questionnaire

Results of the hunter questionnaire for 1992 are shown in Table 9. Long-term trends of pheasants bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 10-12, and total statewide harvest statistics in Table 13. A comparison of 1992 harvest statistics to 1991 and the previous 44-year average follow:

	<u>1992</u>	<u>Percent change from 1991</u>	<u>Average</u>
Pheasant hunters	41,640	-3	-47
Pheasants harvested	85,803	+18	-59
Hunter-days afield	150,244	0	-31
Pheasants per hunter-day	0.57	+18	-39
Pheasants per hunter	2.06	+21	-22

Total hunters again decreased (3 percent) from 1991 and remained below the long-term (1948-91) average. Total harvest increased 18 percent from 1991. Hunter success (pheasants per hunter-day) increased 18 percent from 1991. Pheasants per hunter increased (21 percent), but remains 22 percent below the long-term average.

Long-term trends (1948-92) of total hunters, hunter-days, harvest and hunter success are shown in Figures 3 and 4. Generally, the recent trend is toward less hunter-days with declines in total pheasants harvested and hunter success. We believe this is the result of the accumulated effects of loss of quantity and quality of habitat due to urbanization, flooding, modern agricultural practices, and habitat fragmentation resulting in increased predation.

FIGURES. PHEASANT FIELD BAG CHECK INDICES, 1966-92.

Field Bag Checks

A summary of pheasant field bag check data for 1992 is shown in Table 14. The hunter success trend determined via bag checks since 1987 is found in Table 15 and Figure 5. A comparison of 1992 data, on a statewide basis, to 1991 and the previous 10-year (1982-91) average follow:

	<u>1992</u>	<u>Percent change from</u>	
		<u>1991</u>	<u>Average</u>
Total hunters checked	437	+101	-84
Total hours hunted	558	-2	-93
Pheasants per hunter (complete hunts)	0.46	+10	-3
Pheasants bagged per 100 hours	36	+125	+154
Average hours per hunter-day (complete hunts)	1.28	-51	-61
Hours hunted per pheasant bagged (complete hunts)	2.76	-56	-63

Hunting pressure was down in most of Utah. This is attributed to decreasing pheasant populations and to less land being accessible to hunters.

Although hunter pressure and numbers decreased from 1991 persistent hunters were successful in taking birds and spent less time doing so.

Statewide hunter success was up compared with 1991 through the entire season.

MIGRATORY UPLAND GAME BIRDS

SUMMARY

Mourning Doves

The breeding density index decreased slightly in 1992, and remained well below average.

Harvest statistics derived from the questionnaire indicated a decrease in number of hunters and harvest compared to 1991. However, hunter success for the season increased slightly.

Field bag checks indicated a slight increase in hunter success on opening day. Hunters who participated hunted more hours than the previous year, but spent less time afield per dove harvested.

Aging of wings indicated the juvenile per 100 adult ratio decreased to 92 compared to 116 in 1991. Juvenile per 100 adult ratio remains 21 percent below the long-term average.

Band-tailed Pigeons

A band-tailed pigeon hunting permit was required again in 1992 to obtain mailing addresses for a questionnaire. Twenty hunters purchased permits and 18 went afield. A total of 73 pigeons were harvested. Hunter interest remains low.

MOURNING DOVE

Call Count Survey

Results of the 1992 call count survey are found in Table 1 of this section. The long-term trend of the state's breeding density index (average doves heard per route) is shown in Table 2. Indices shown in each of these tables are unweighted and consequently differ from those published in the annual Mourning Dove Status Report compiled by the U.S. Fish and Wildlife Service. However, indicated trends are similar (Figure 1). The following is a comparison of the results of the 1992 survey compared to 1991 and the average for the period 1968-1991:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Average doves heard per route	9.20	-8	-20
Average doves seen per route	5.53	-31	-44

Coo count data indicated slightly decreased breeding activity in late May compared to 1991, but was 20 percent below the long-term average of doves heard per route.

Harvest

Hunter Questionnaire

Information obtained from the hunter questionnaire for 1992 is summarized in Table 3. Long-term trends of mourning doves bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 4-6 and total statewide harvest statistics in Table 7 and Figures 2 and 3. The following is a comparison of the harvest statistics for 1992 compared to 1991 and the previous 41-year average:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Mourning dove hunters	18,021	-20	-19
Mourning doves harvested	161,902	-9	-22
Hunter-days afield	68,937	-12	0
Mourning doves per hunter-day	2.35	+3	-30
Mourning doves per hunter	8.98	+14	-1

Dove hunter success was predicted to be similar to 1991 due to the second year of no significant change in the spring dove call count index and summer drought. Hunter success dropped slightly from 1991. Total harvest decreased 9 percent compared to 1991. Numbers of dove hunters and hunter-days afield decreased slightly. Doves per hunter-day and doves per hunter increased slightly from 1991.

Long-term harvest trends are depicted in Figure 2.

AVERAGE DOVES HEARD PER ROUTE

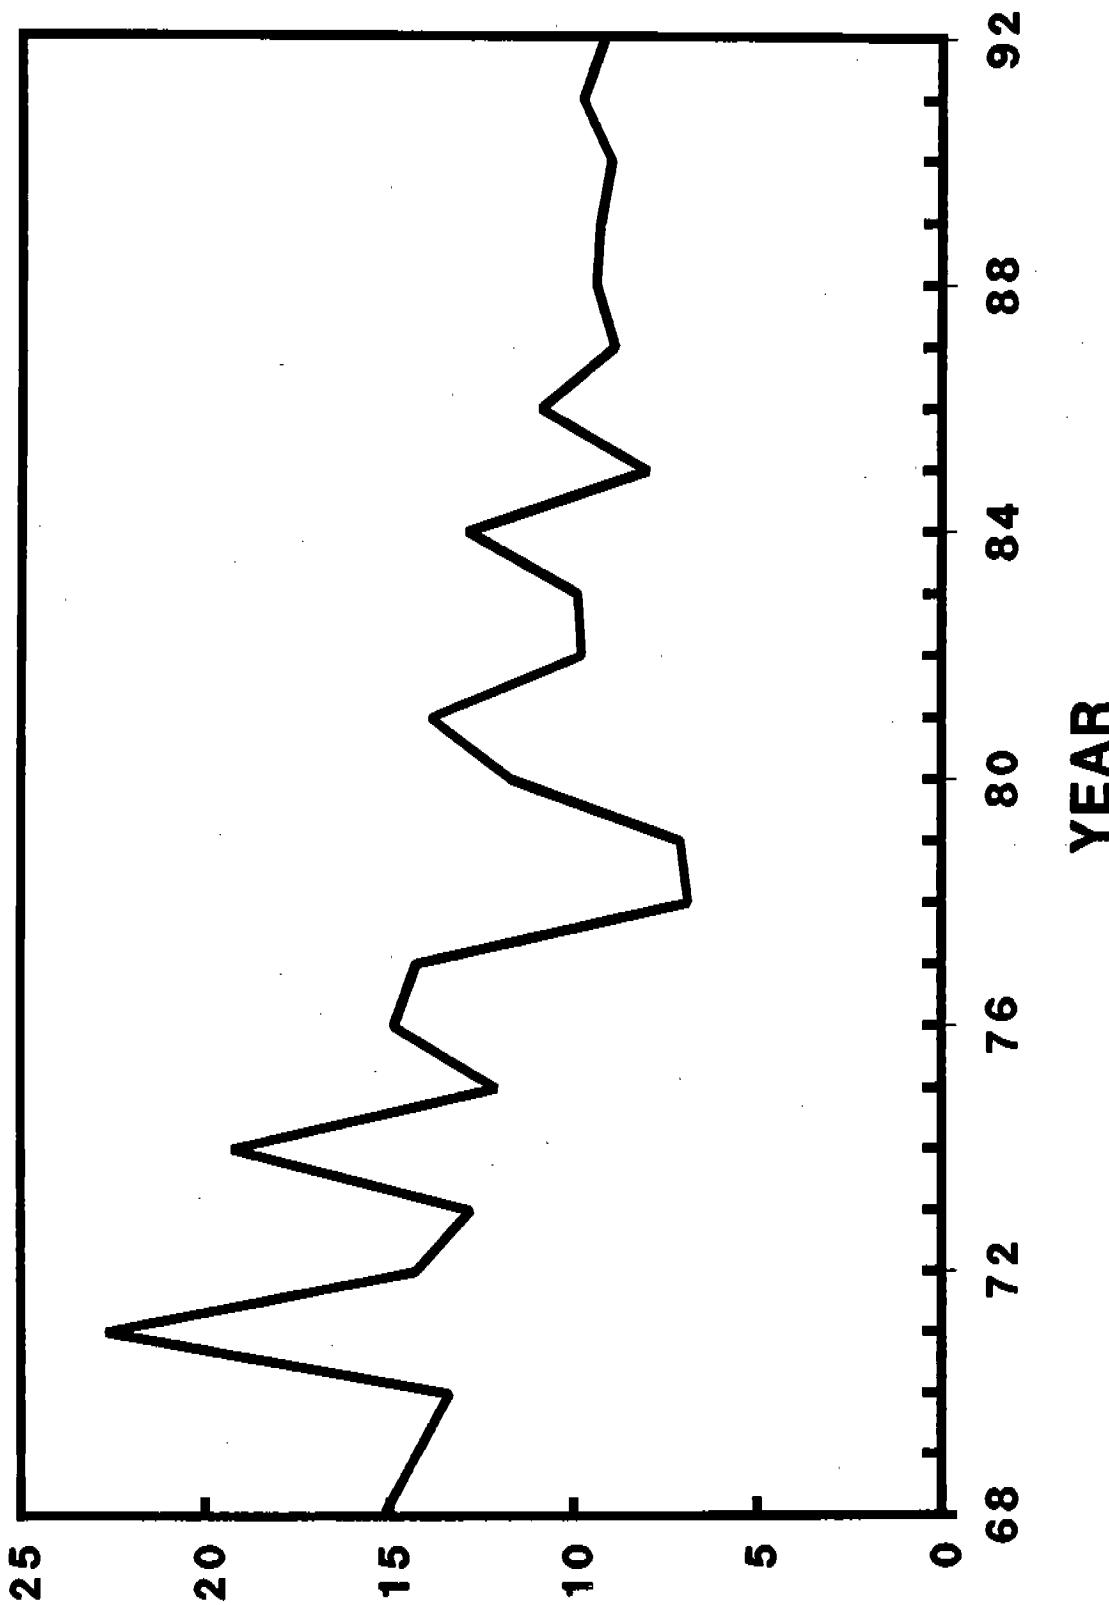

Figure 1. Mourning dove breeding density index trend, 1968-92.

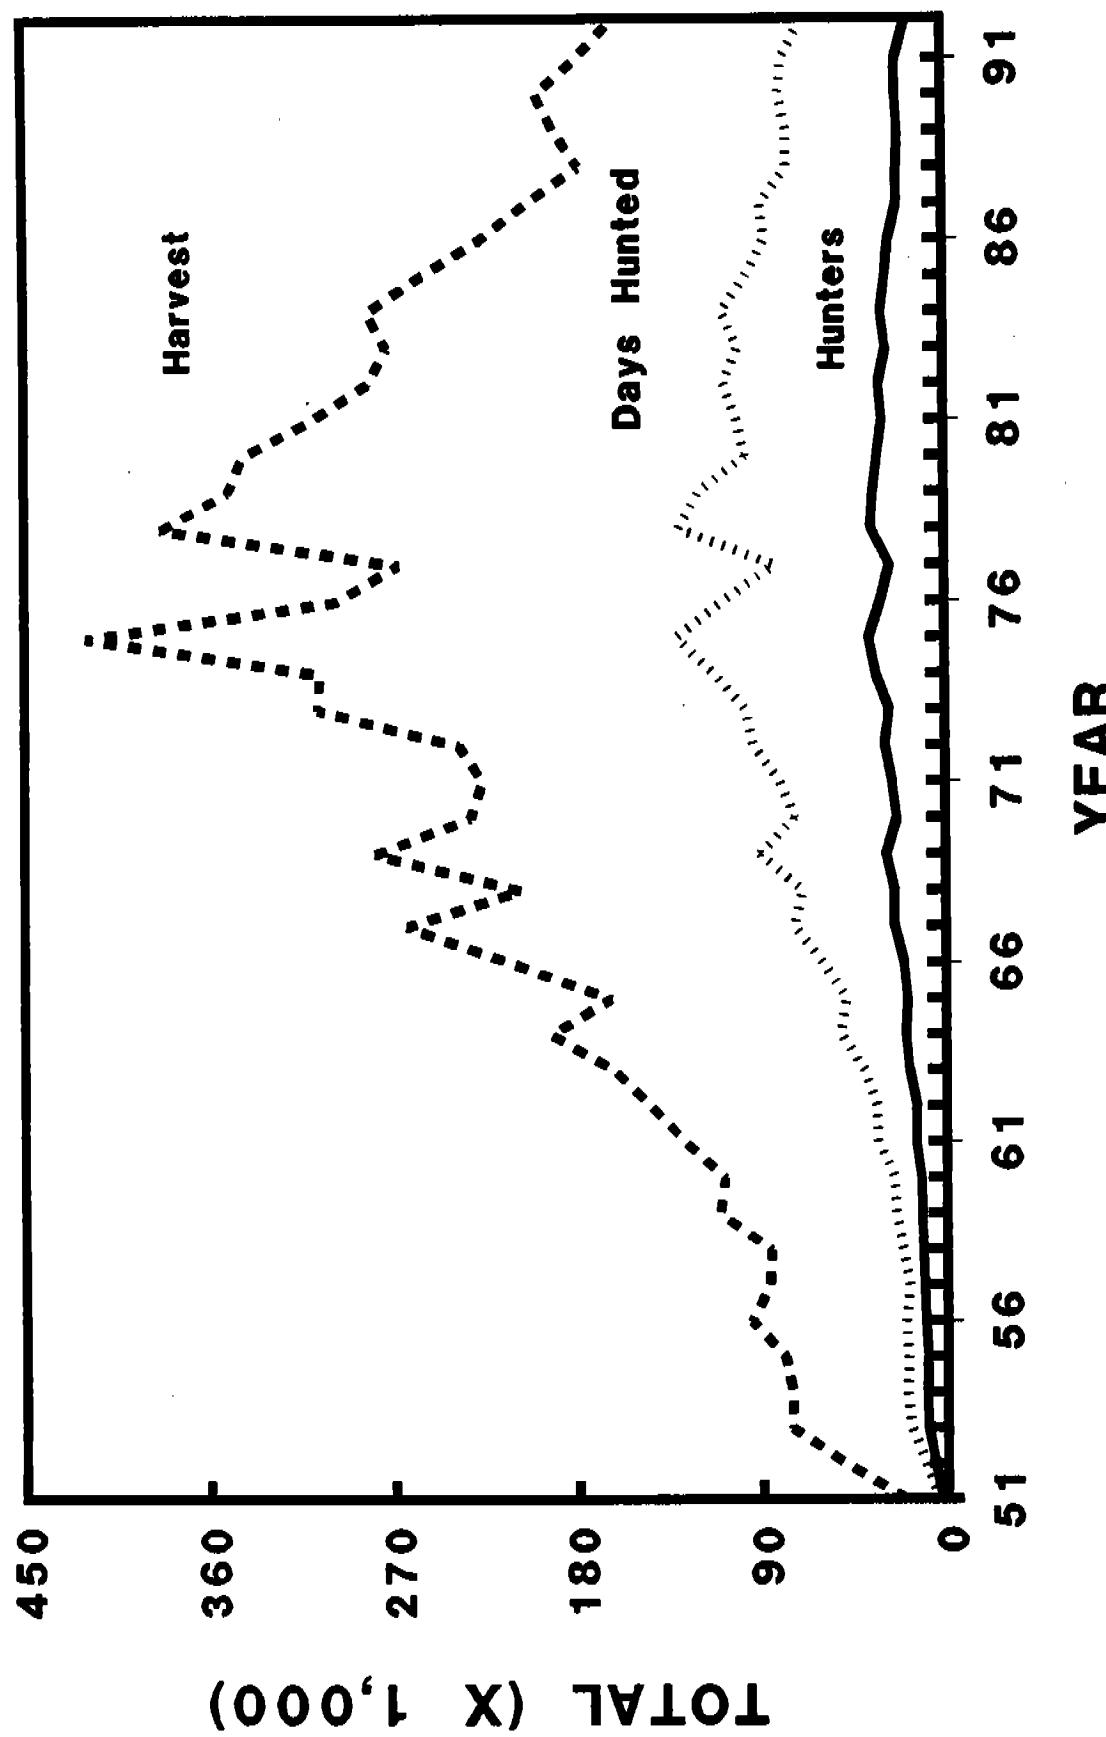

Figure 2. Statewide trends of mourning dove harvest statistics, 1951-92.

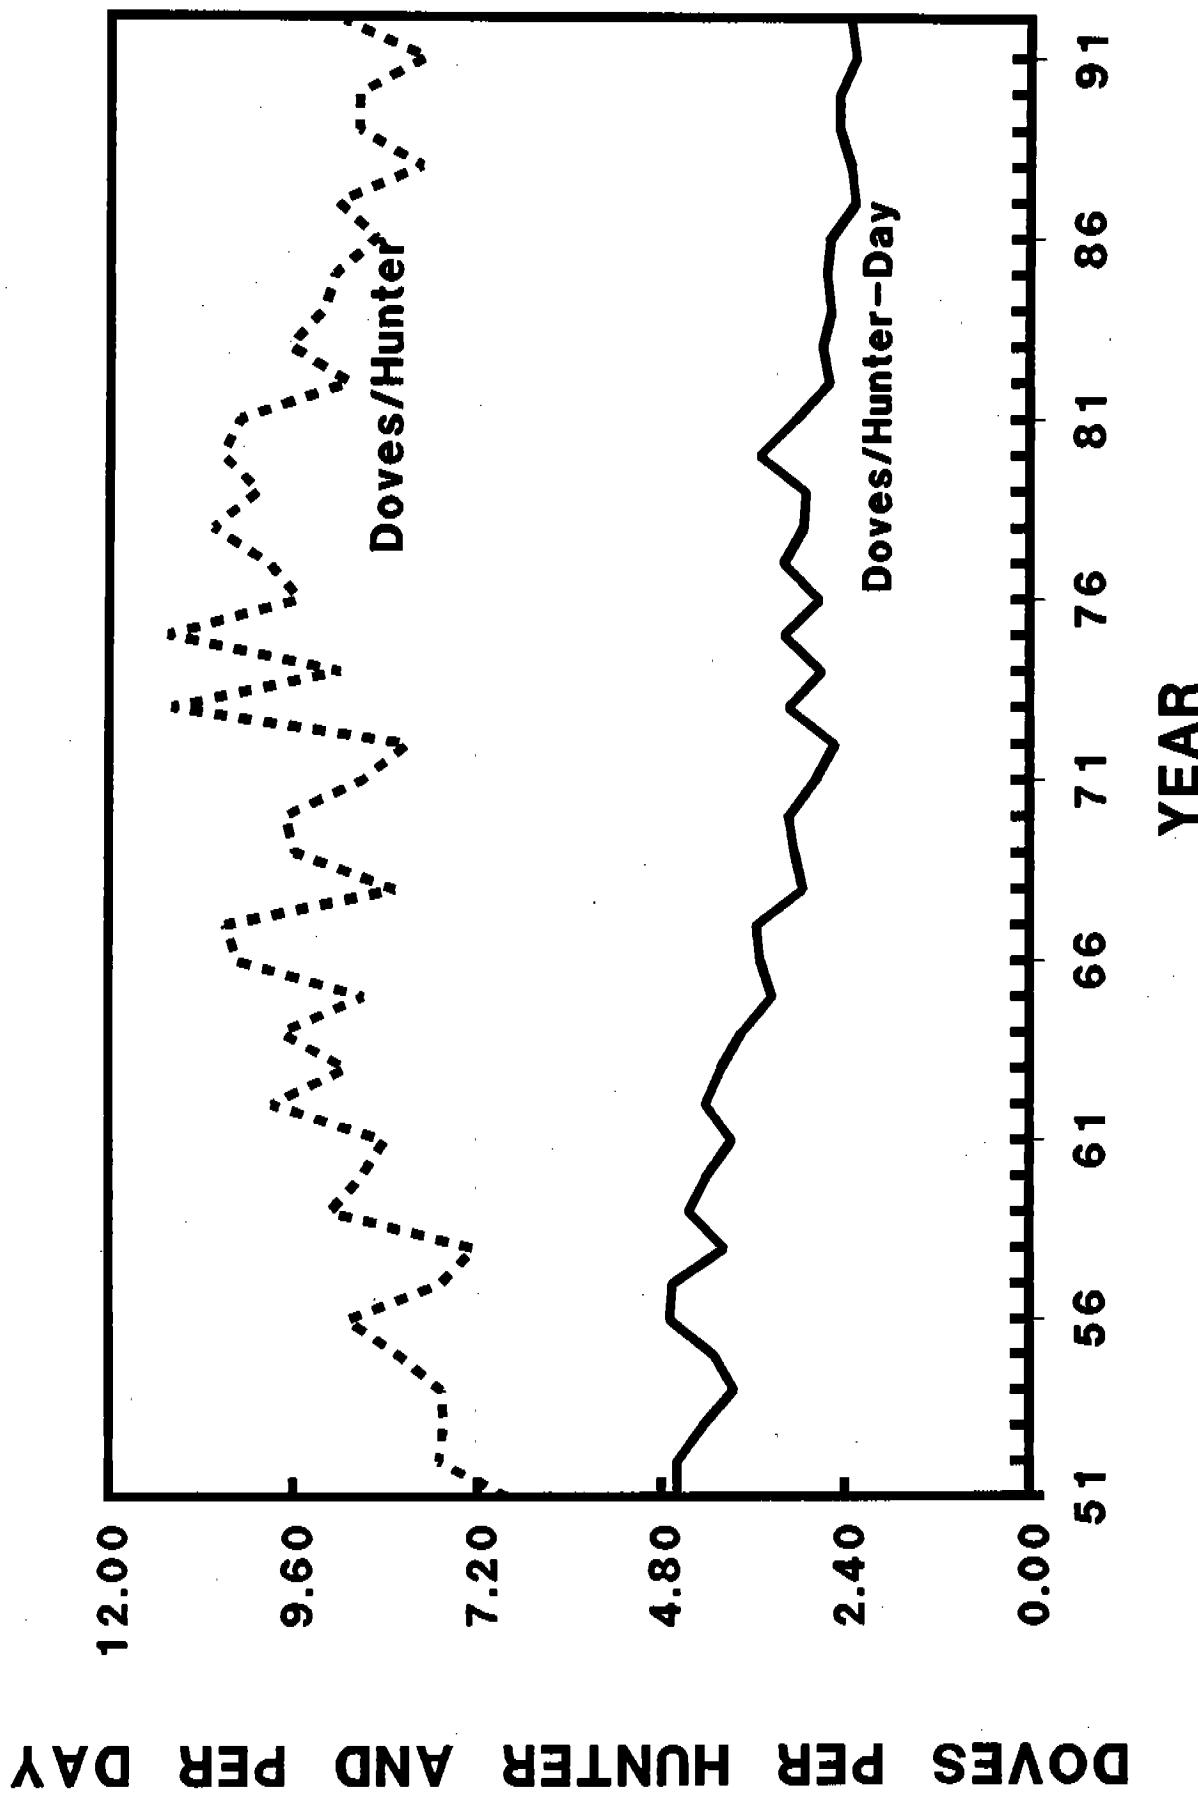

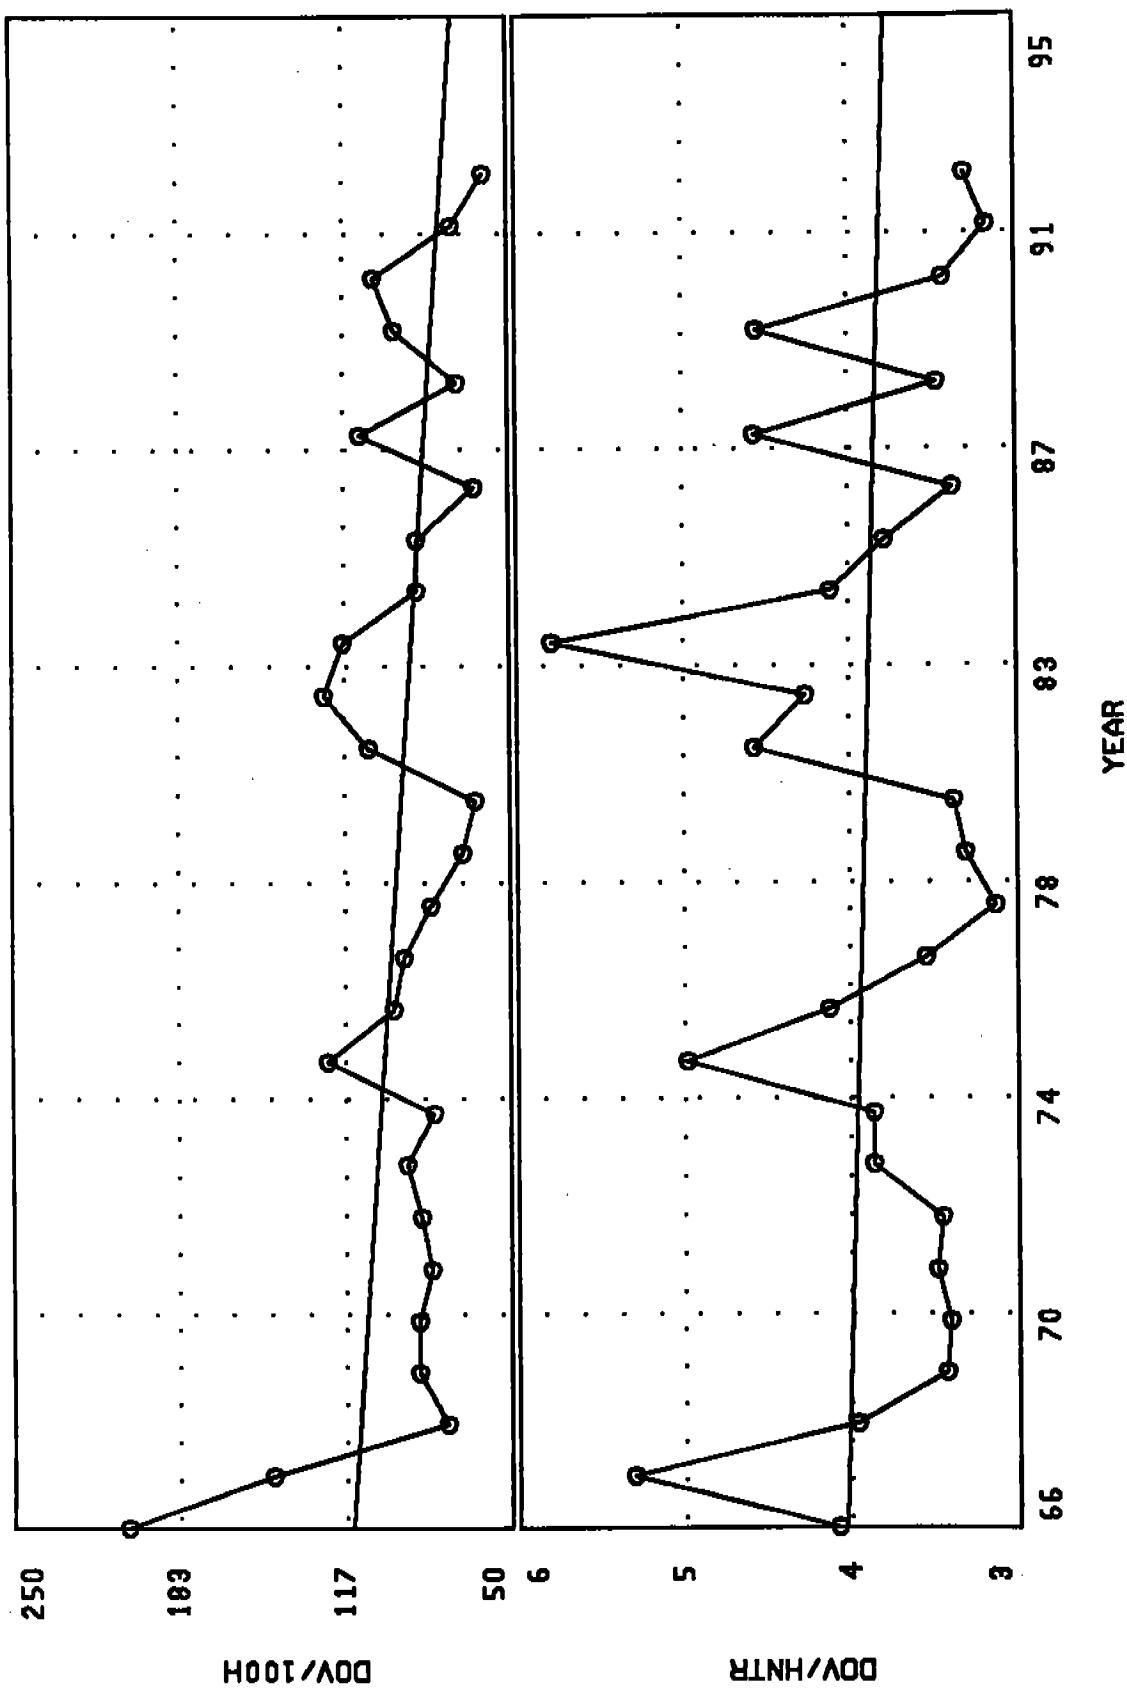

Figure 3. Statewide trends of mourning dove hunter success rates, 1951-92.

FIGURE 4. MOURNING DOVE FIELD BAG
CHECK INDICES, 1966-92.

Field Bag Checks

A summary of field bag check data for 1992 is shown in Table 8. Hunter success trends determined via this method are shown in Table 9. Results of the 1992 survey compared to 1991 and the 10-year average (1982-91) follow:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Total hunters checked	392	-62	-75
Total hours hunted	1,853	-51	-68
Doves per hunter (complete hunts)	2.85	+6	-24
Doves bagged per 100 hours (complete hunts)	60	-18	-33
Average hours per hunter-day (complete hunts)	4.72	+28	+21
Hours hunted per dove bagged (complete hunts)	0.60	-56	-45

This year's hunt opened on Tuesday, September 1, 1992. Hunter participation could have been off a bit because of the weekday opening. Field bag checks indicated a slight increase in hunter success. The total number of hunters checked was down 62 percent from 1991. Dove hunters spent more time afield per hunter-day than in 1991, and less time was spent per dove bagged, according to field bag check data.

Age Composition of the Harvest

A summary of the age composition of harvested mourning doves from 1983 through 1992 is contained in Table 10. Hatching dates for immature doves harvested in the Northern Region since 1982 are shown in Table 11. Hatching dates for immature doves harvested in Utah in 1992 are shown in Table 12.

Following is a comparison of data collected in 1992 compared to 1991 and long-term averages (1966-91):

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Sample size	887	-52	-72
Immatures/100 adults	92	-19	-21
Percent of immatures hatched on: (N. Region)			
August 3 or later	37.82	--	+7
July 25 or later	79.96	--	+9
Before July 25	20.04	--	+6

Sample size decreased 52 percent in 1992. The 92 immatures per 100 adults in the harvest was down 19 percent from the previous year and 21 percent below the 26-year average.

BAND-TAILED PIGEON

Banding

Between 1969 and 1978, 2,649 total pigeons were banded in Utah and 975 recaptured. Results of banding efforts through 1972 indicated a direct recovery rate of 1.4 percent. If expanded, using an assumed 30 percent band reporting rate, an estimated harvest rate of less than 5 percent of the state's pigeon population is indicated. Addition of an estimated 16 percent crippling loss would result in a total kill rate of from 5-10 percent, well within the harvestable surplus.

Harvest

Results of the 1992 band-tailed pigeon harvest is in Table 13. Permits were required in 1992 and a questionnaire was sent to participants. Only 20 hunters purchased the \$3.00 band-tailed pigeon permit in 1992. Harvest trends since 1970 are shown in Figures 4 & 5 and Table 14.

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Band-tailed pigeon hunters	18	+20	-62
Band-tailed pigeon harvest	73	+135	-44
Hunter-days afield	70	+250	-43
Pigeons per hunter-day	1.05	-30	+3
Pigeons per hunter	4.29	+104	+55

Band-tailed pigeon hunters afield increased slightly from 1991, but remains 62 percent below the long-term average. Hunter success rates remained above the long-term average. Seventy-three birds were harvested. Forty-two of these were suspected of being feral pigeons due to the location of harvest. Pigeon harvest was reported in Beaver, Davis, Iron, San Juan, Sanpete, Utah and Washington Counties. Most of the harvest for 1992 was reported in Davis County, but these birds were suspected of being feral.

CHUKAR PARTRIDGE

SUMMARY

The statewide breeding population of chukars decreased slightly in 1992 following the seventh straight year of drought over much of Utah. Late winter and early spring precipitation, critical to successful chukar production, was average.

Results of the brood survey indicated that brood production was below average. Chukar density decreased during 1992, and was below average.

Harvest statistics from mail questionnaires reflected an increase in harvest. Hunter success (chukars per hunter-day) increased slightly from 1991. Chukar hunters increased by 5 percent, while time afield decreased 45 percent from the year before. Hunting success on opening weekend, as measured by field bag checks, indicated increased hunter success.

Interest in chukar hunting increased in 1992. This may be as a result of sportsmen exploring bird hunting opportunities other than the more popular pheasants and mourning doves because of decreased populations.

Brood Counts

Results of the annual random brood survey for 1992 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and chukars observed per 100 hours are found in Tables 2-4 and Figure 1. Following are the survey results for 1992 compared to 1991 and the 10-year (1982-91) average:

	<u>1992</u>	<u>Percent change from 1991</u>	<u>Average</u>
Total chukars observed	126	+66	-76
Young per 100 adults	215	-60	-52
Mean brood size	7.83	+7	+4
Chukars observed per 100 hours	200	-25	-55
Total hours effort	63	+117	-47

Harvest data for 1991 indicated breeding populations for 1992 were still significantly below statewide averages. However, winter and early spring precipitation (January-April) was average over the entire state (Figure 4). Summer drought continued over most of Utah for the seventh straight year.

Effort on chukar brood counts increased significantly in 1992 but remained below average.

Brood count sample sizes were again small or nonexistent for all regions. Chukar density remained below the 10-year average and production seemed to be down from 1991.

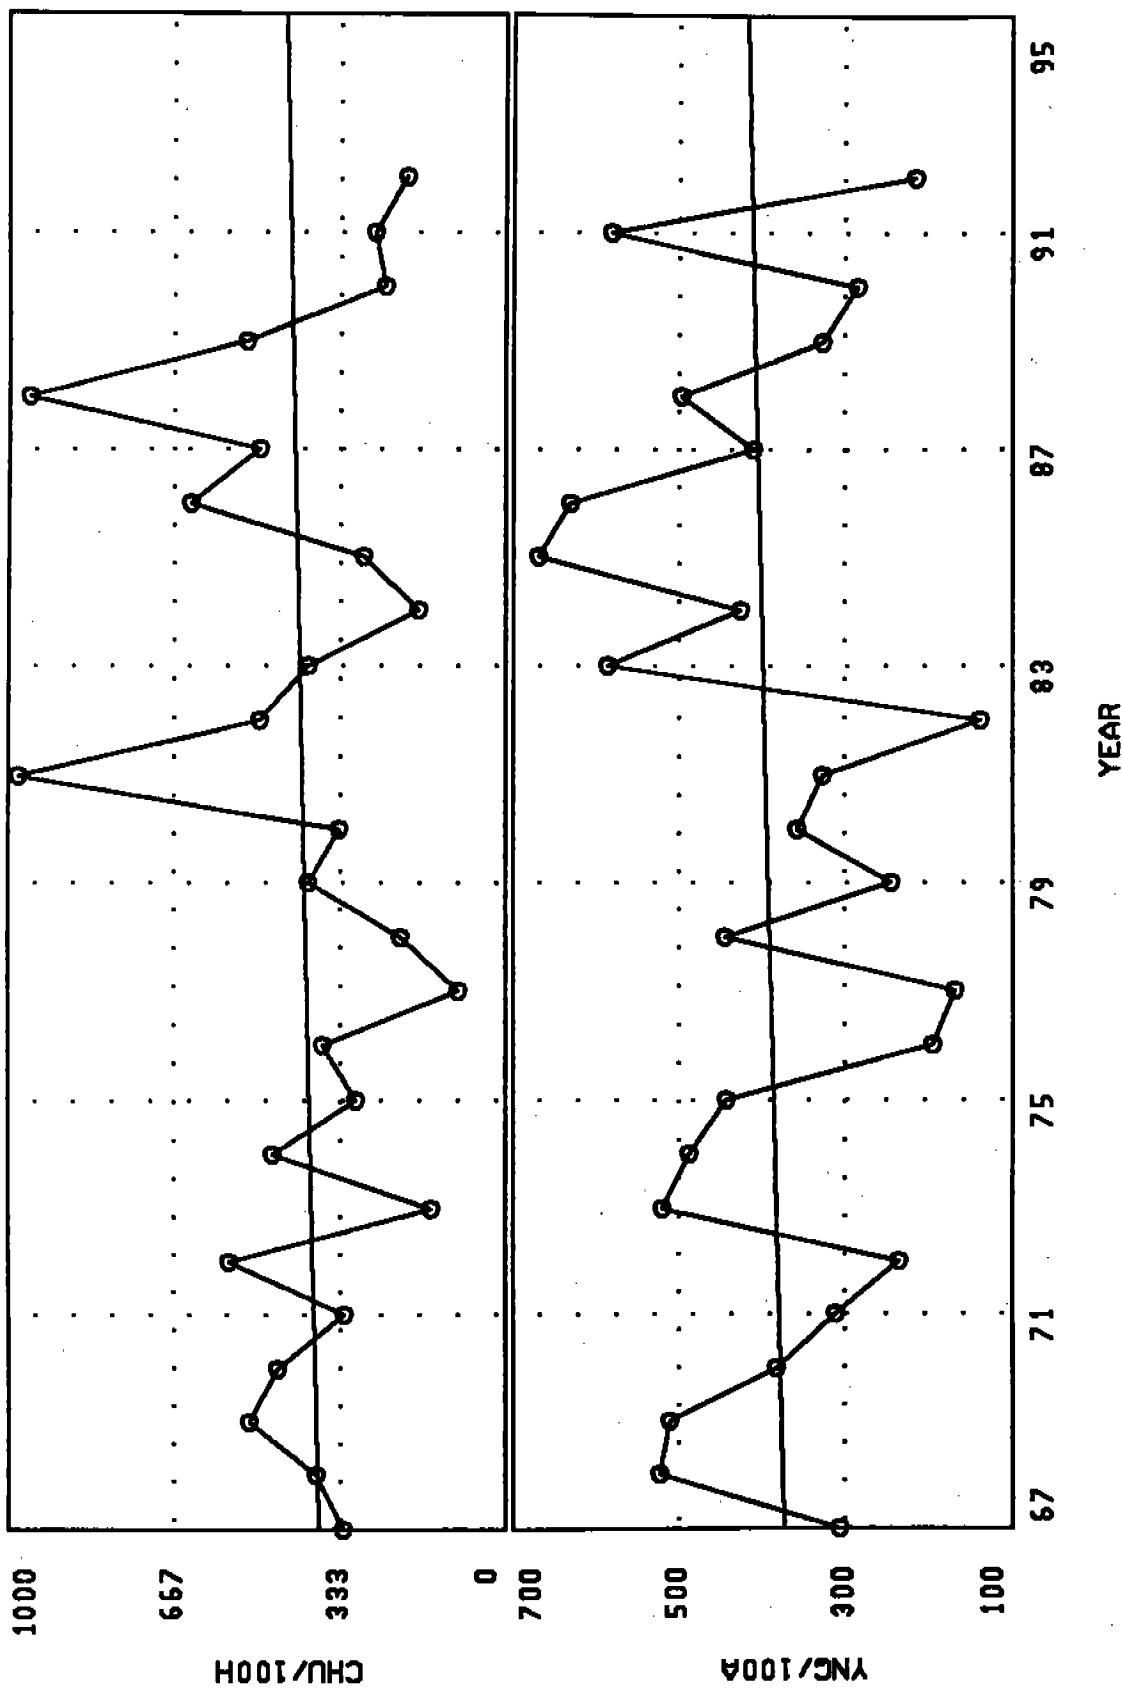

Harvest

Hunter Questionnaire

Results of the hunter questionnaire survey for 1992 are shown in Table 5. Long-term trends of chukars bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9 and Figures 2 and 3. Following is a comparison of 1992 harvest statistics to 1991 and the previous 34-year average:

	<u>1992</u>	<u>Percent change from 1991</u>	<u>Average</u>
Chukar hunters	11,125	+5	-20
Chukars harvested	28,599	+17	-27
Hunter-days afield	37,463	+10	-11
Chukars per hunter-day	0.76	+6	-16
Chukars per hunter	2.57	+12	-6

FIGURE 1. CHUKAR PRODUCTION
INDICES, 1967-92.

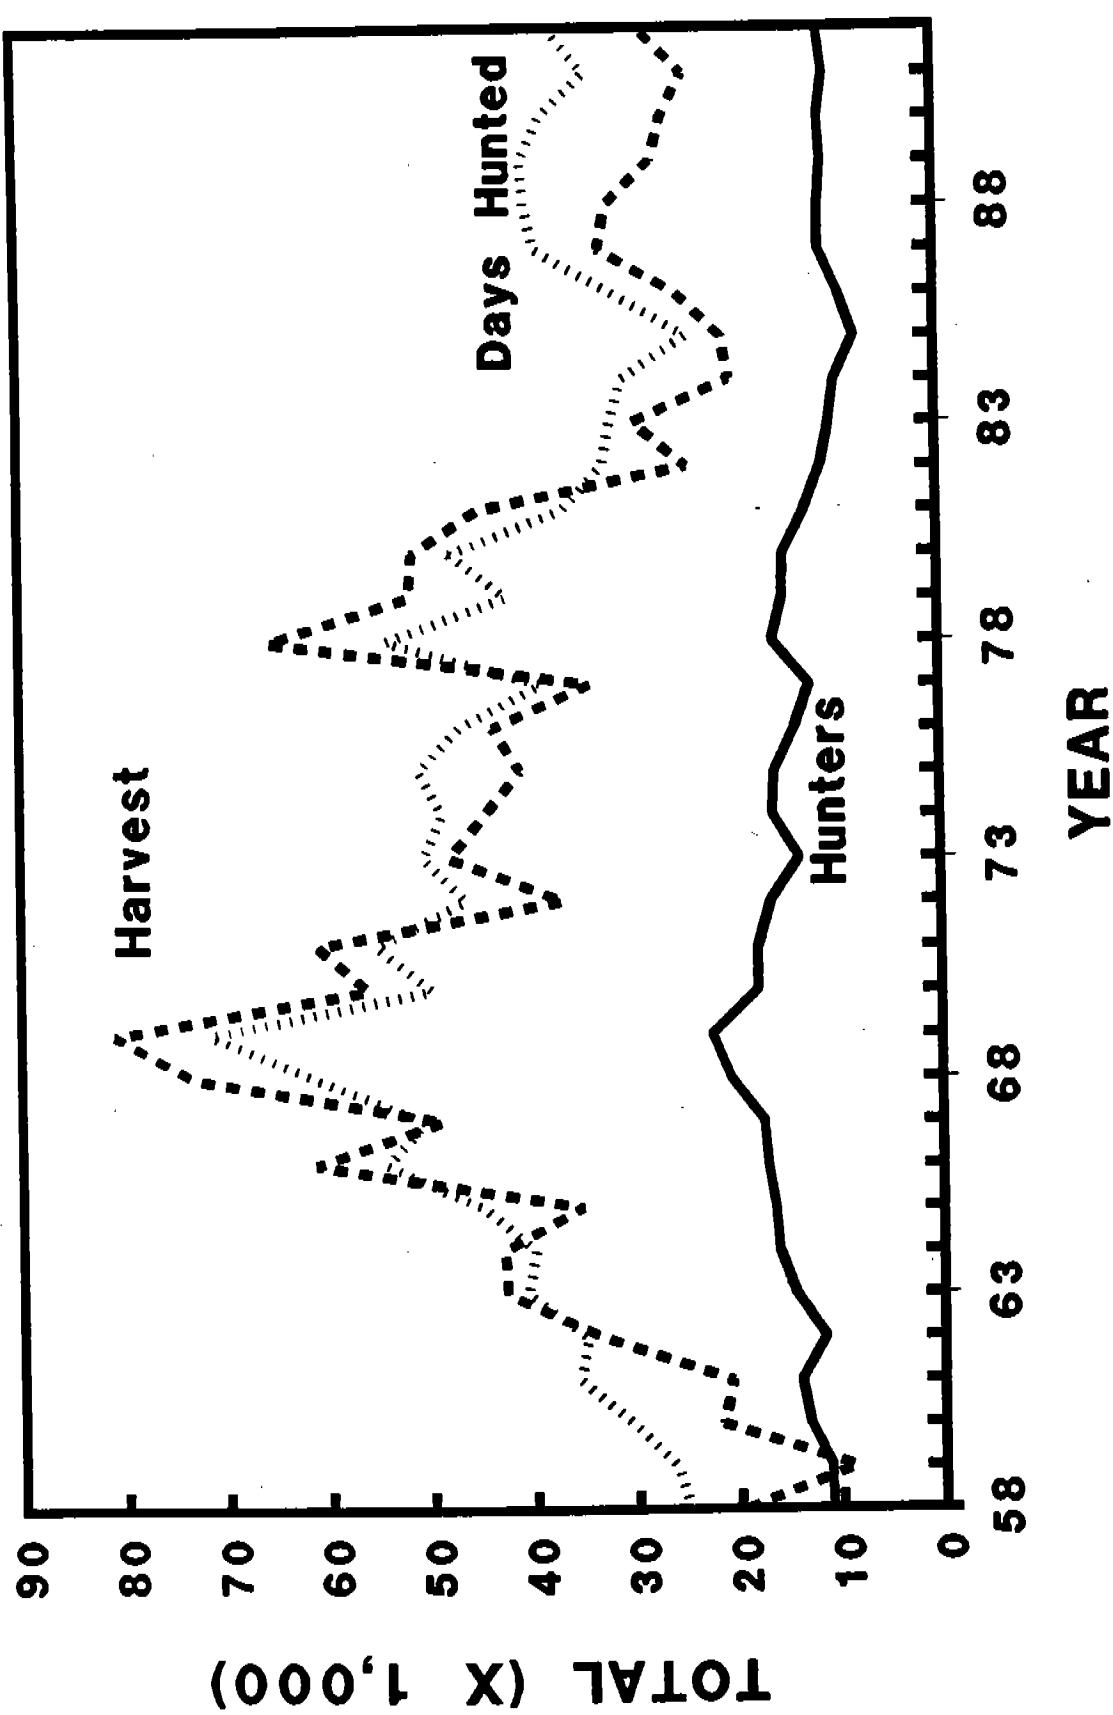

Figure 2. Statewide trends of chukar partridge harvest statistics, 1958-92.

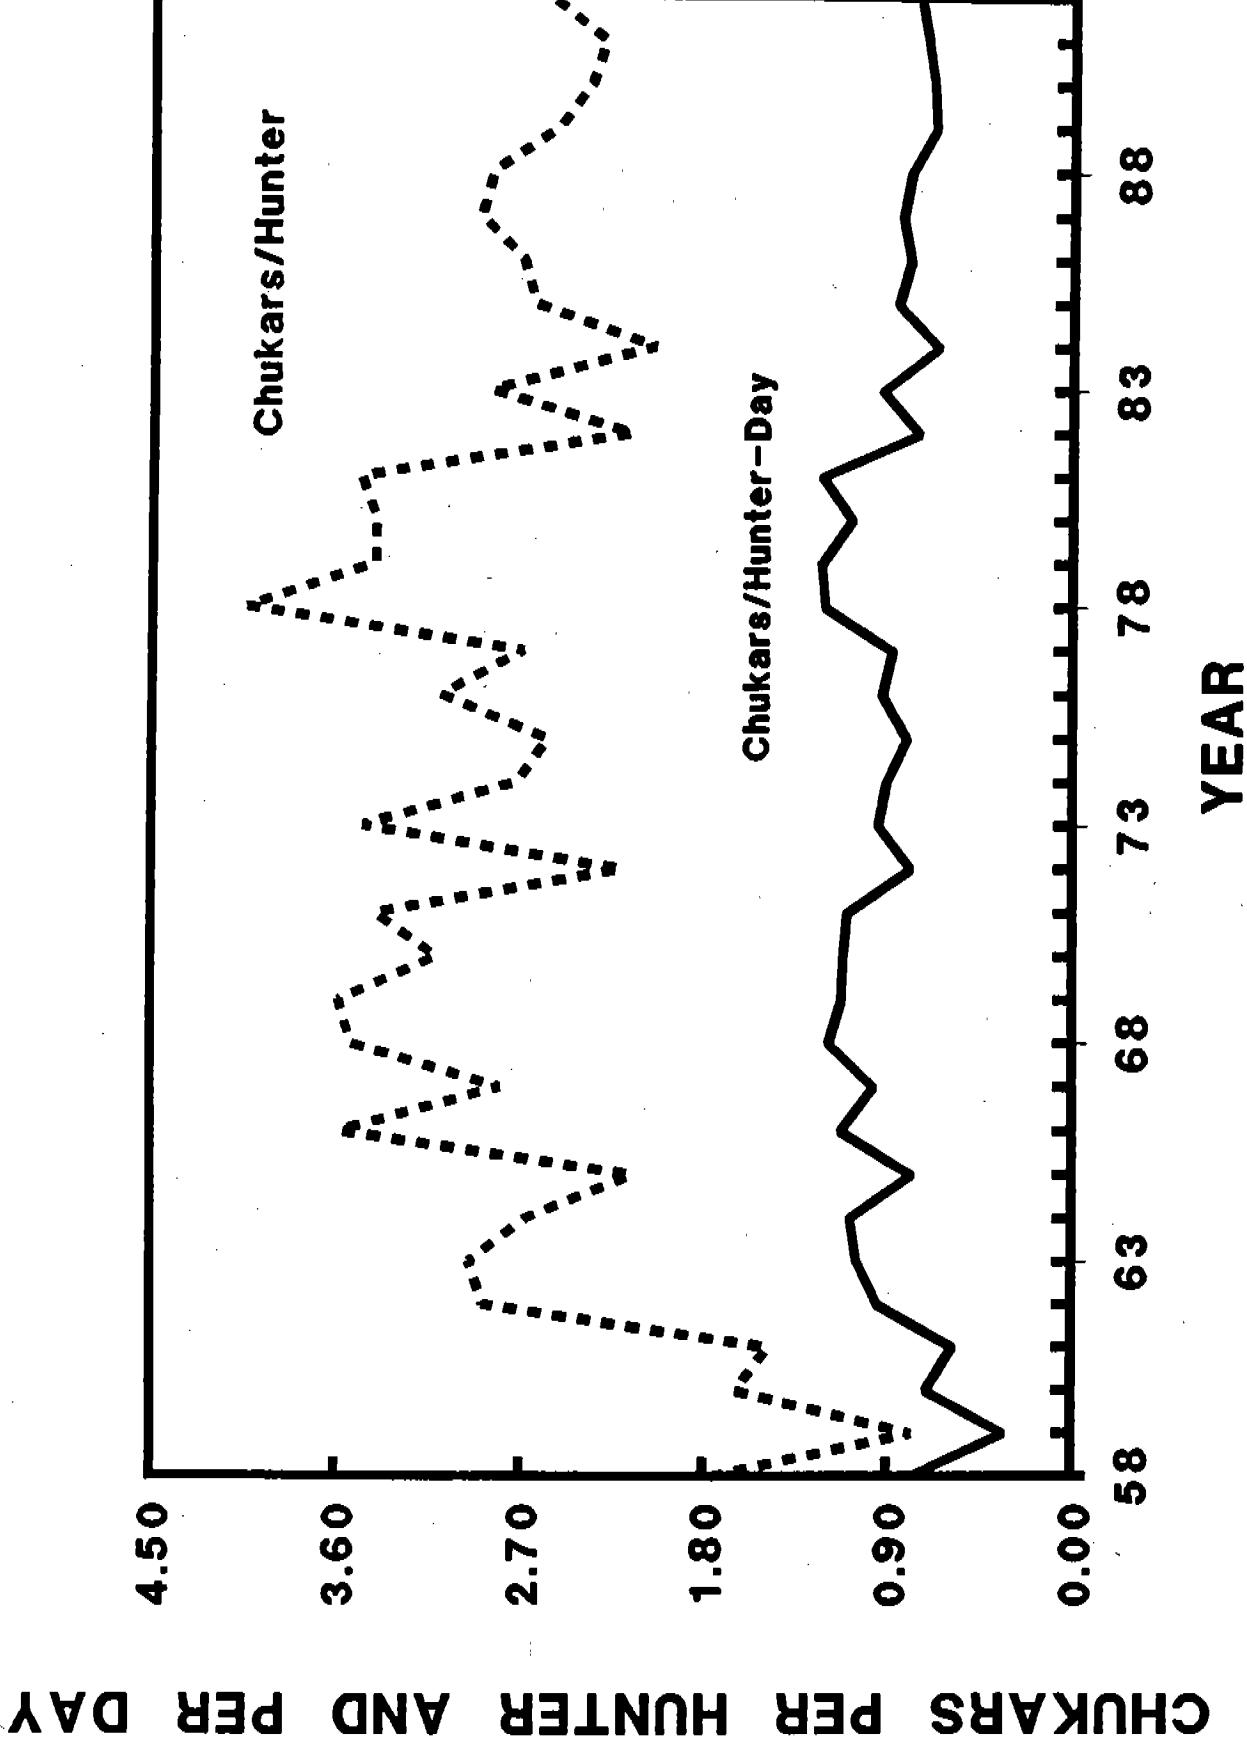

Figure 3. Statewide trends of chukar hunter success rates, 1958-92.

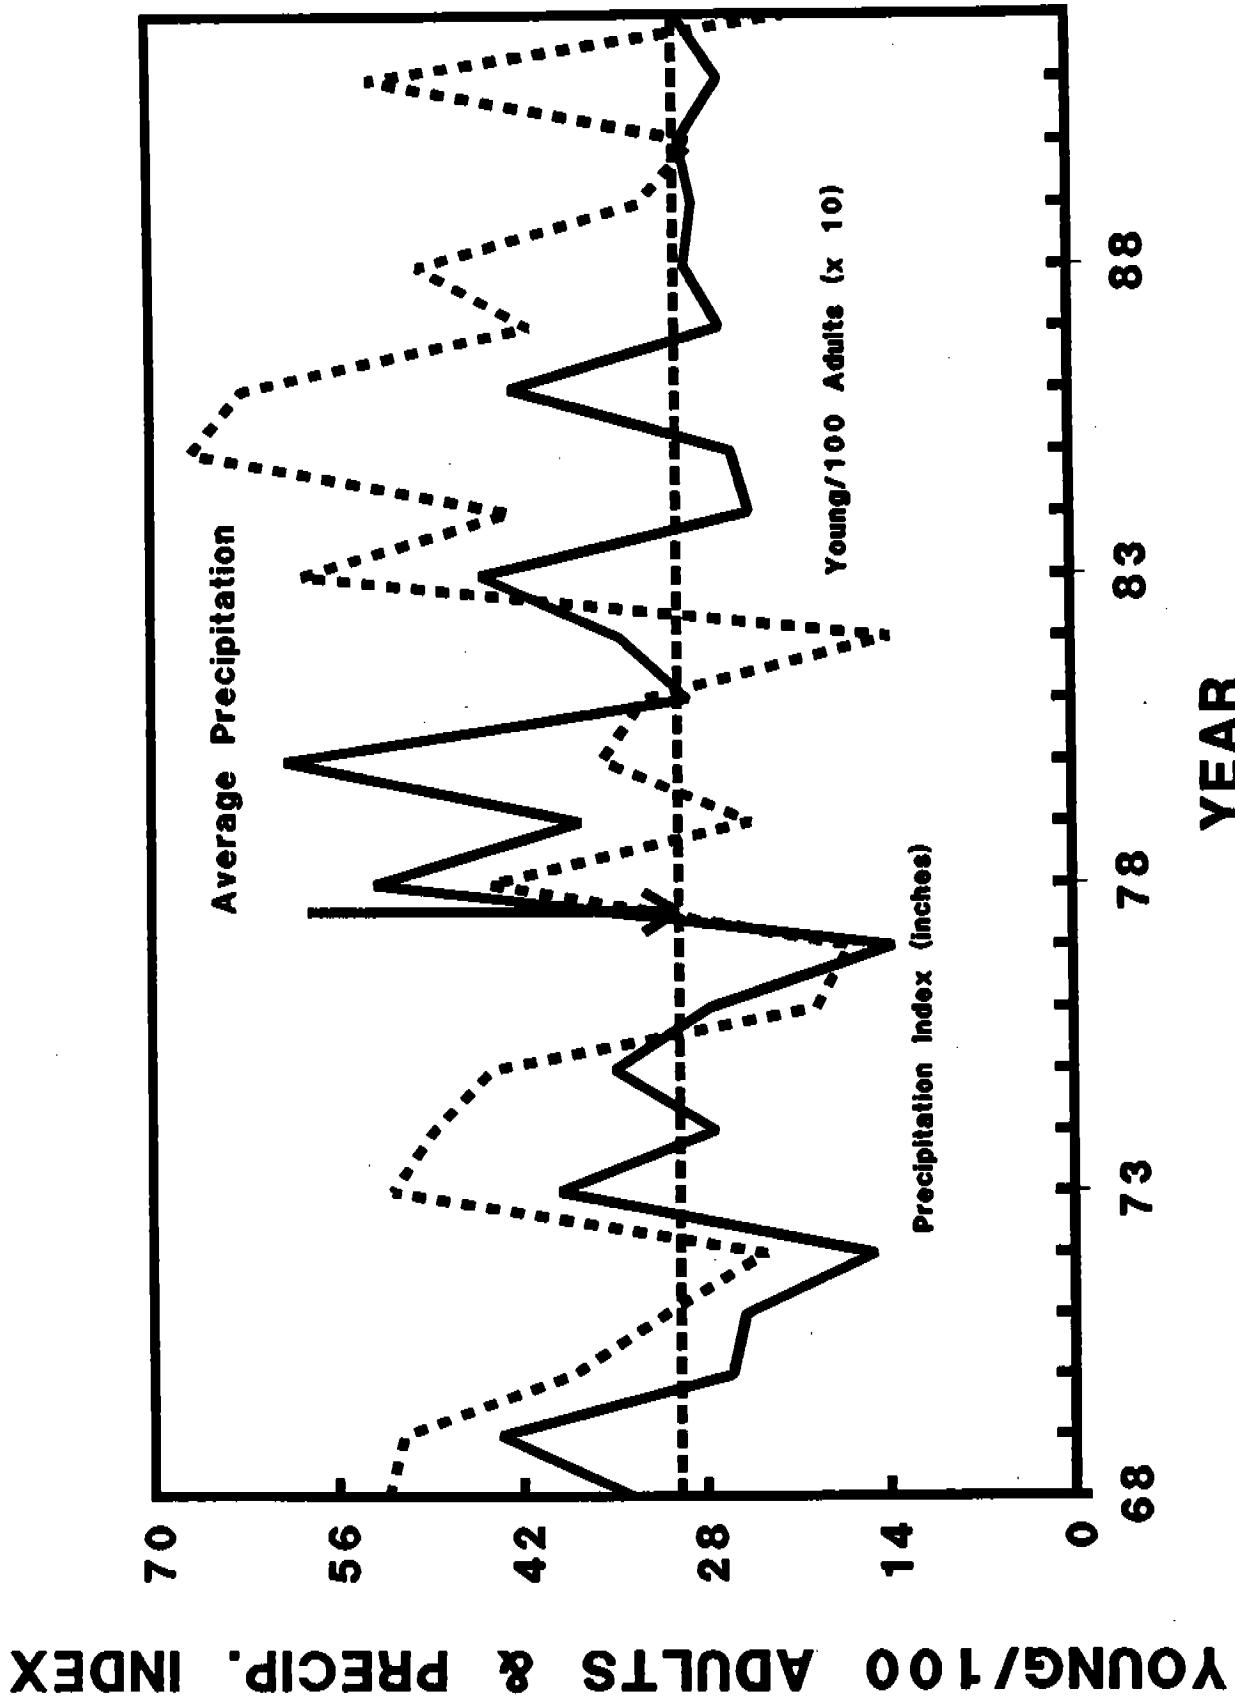

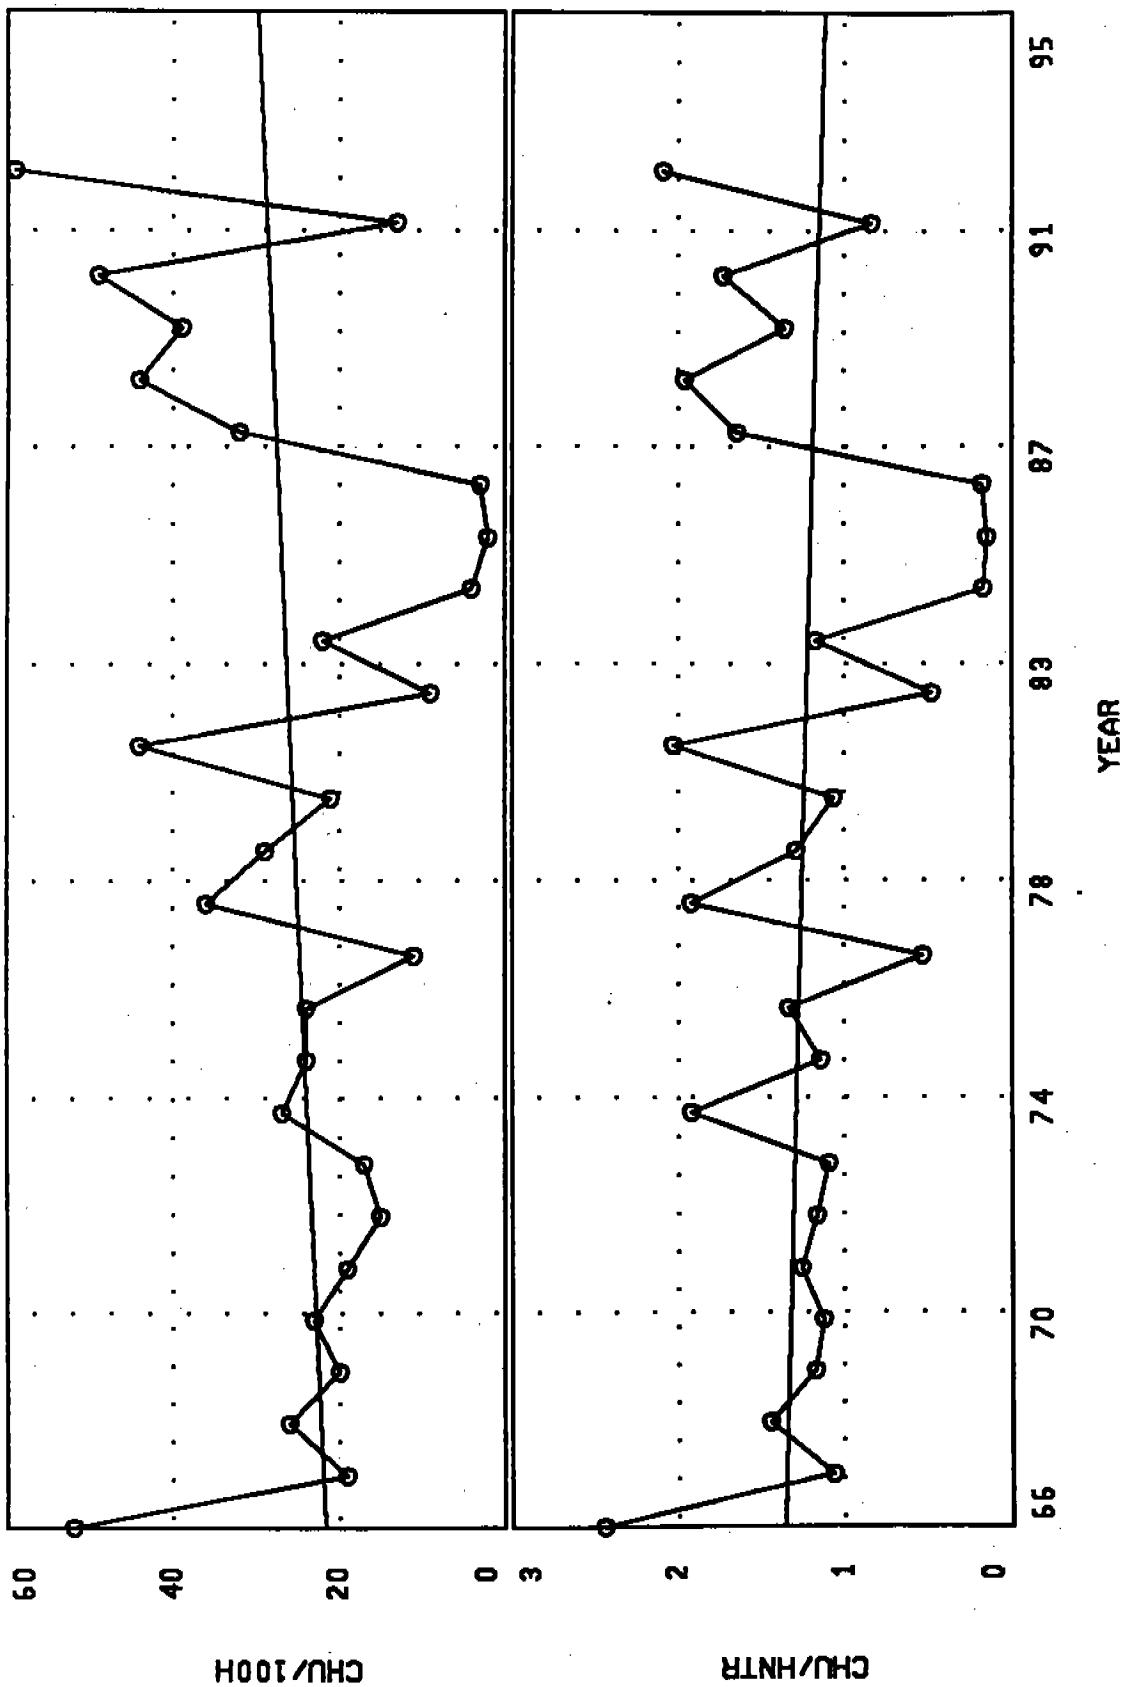

Figure 4. Relationship between late winter and early spring (Jan.-April) precipitation and chukar production, 1968-92.

FIGURES. CHUKAR FIELD BAG CHECK
INDICES, 1966-92.

Chukar hunters and hunter effort increased from 1991. Chukars per hunter-day increased slightly from 1991, but remains 16 percent below the statewide average. Total harvest increased 18 percent. The Central Region again had the highest percentage of the harvest (51%) in 1992, and also had the highest percentage of hunter pressure (52%).

Field Bag Checks

A summary of field bag check data for 1992 is shown in Table 10. The hunter success trend determined by field bag checks since 1987 is shown in Table 11 and Figure 5. Data for the 1992 season compared to 1991 and the 10-year (1982-91) average follow:

	<u>1992</u>	<u>1991</u>	<u>Percent change from Average</u>
Total hunters checked	27	0	-88
Total hours hunted	79	-46	-92
Chukars per hunter (complete hunts)	1.74	+149	+116
Chukars bagged per 100 hours (complete hunts)	59	+354	+165
Average hours per hunter-day (complete hunts)	2.93	-45	-34
Hours hunted per chukar bagged (complete hunts)	1.68	-78	-89

Field bag checks indicated hunter success on opening weekend was up from 1991 and was well above average. This may be the result of higher vulnerability of birds as they congregated around water sources. However, sample sizes were extremely small.

Table 1. Chukar summer inventory, 1992.

SAGE GROUSE

SUMMARY

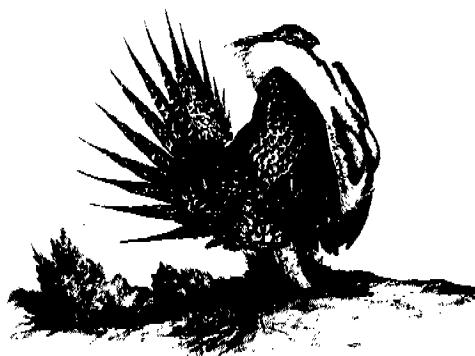

S
A
G
E

G
R
O
U
S
E

Harvest data for 1991 indicated above average breeding populations of sage grouse for 1992. Strutting ground surveys indicated an increase in the average male grouse attendance from 1991.

Brood surveys showed decreased production throughout the state. Birds observed per 100 hours remained about the same as in 1991, and was 10 percent below average. The ratio of young to adults decreased 22 percent compared to 1991 and was 38 percent below average.

The decrease in production, as indicated from brood counts, in 1992, was apparent in harvest statistics collected from questionnaires and from field bag checks. Harvest was just below the 42-year average. Age ratios derived from wings indicated a 32 percent increase in young per 100 adults and was 26 percent below average.

Strutting Ground Counts

The status of the sage grouse breeding population for 1992, as indicated by strutting ground counts, is shown in Table 1 and Figure 1 of this section. Results of this survey for 1992 compared to 1991 and the 1967-91 average follow:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Number of grounds counted	125	+76	+15
Total male grouse counted	2,050	+64	0
Average male grouse per ground	16	+100	-14
Percent change from previous year (comparable grounds)	+3		

Access for spring 1992 strutting ground counts was generally good in most regions of the state. The numbers of male grouse observed increased 64 percent statewide. Harvest data for 1991 indicated decreased populations going into the winter of 1991-92, and the numbers of juvenile birds observed during the summer indicated decreased production compared to 1991. Loss of habitat continues to be the trend in many areas of the state.

Brood Counts

Results of the summer inventory survey for 1992 are found in Table 2. Long-term trends of young per adult ratios, mean brood size and sage grouse observed per 100 hours are shown in Tables 3-5 and Figure 2. Indices for 1992 are compared to 1991 and the previous 10-year (1982-91) average as follows:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Total sage grouse counted	710	+30	-39
Young per 100 adults	95	-22	-38
Mean brood size	4.21	+14	-5
Sage grouse observed per 100 hours	272	0	-10
Total hours effort	261	+30	-32

The effort devoted to sage grouse brood counts was 32 percent below average, and the total number of grouse counted was 39 percent below average.

Sage grouse density remained about the same as in 1991, production of young per 100 adults decreased 22 percent. The average brood size was 5 percent below the 10-year average. Continued drought conditions may have negatively influenced brood survival or caused an earlier dispersal of broods.

FIGURES. SAGE GROUSE FIELD BAG
CHECK INDICES, 1966-92.

Harvest

Hunter Questionnaire

Results of the 1992 hunter questionnaire are shown in Table 6. Long-term trends of sage grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 7-9 and total statewide harvest statistics in Table 10. The results of the 1991 hunting season compared to 1991 and the previous 42-year average follow:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Sage grouse hunters	7,392	-8	-1
Sage grouse harvested	12,156	-3	+10
Hunter-days afield	15,781	-15	+20
Sage grouse per hunter-day	0.77	+15	+26
Sage grouse per hunter	1.64	+5	-11

Sage grouse per hunter-day success rate increased 15 percent in 1992. Total statewide harvest decreased 23 percent, and there was a slight decrease in total sage grouse hunters. Forty-three percent of the harvest and 42 percent of the hunting pressure still occurred in the Northern region.

Long-term sage grouse harvest trends are shown in Figures 3 and 4.

Field Bag Checks

A summary of field bag check data for 1992 is shown in Table 11. Hunter success trends determined via this method are shown in Table 12 and Figure 5. Results of the 1992 survey compared to 1991 and the 10-year (1982-91) average follow:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Total hunters checked	575	-39	-46
Total hours hunted	3,651	-27	-29
Sage grouse per hunter (complete hunts)	0.88	+17	-13
Sage grouse bagged per 100 hours	14	0	-29
Average hours per hunter-day (complete hunts)	6.35	+21	+24
Hours hunted per grouse bagged (complete hunts)	7.23	+3	+29

Much of Utah was again dry with birds concentrated around available water. Hunter success rates from field bag checks showed slightly increased success for 1992 compared to 1991. However, more time was spent afield per grouse bagged.

Sex and Age Composition of the Harvest

A summary of the sex and age composition of harvested sage grouse in 1992 is found in Table 13 and the trend from 1989-92 in Table 14.

Following are data derived from wing surveys in 1992 compared to 1991 and the 1973-91 average:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Sample size	930	-1	-17
Percent males	41	-2	0
Percent females	59	+2	0
Young per 100 adults	107	+32	-26
Young per 100 hens (adult)	169	+24	-23

Analysis of wings collected at checking stations during the 1992 season indicates that statewide production was up compared to 1991, and was below the previous 19-year average. This indicates that early brood dispersal occurred probably as a result of the continuing drought.

FOREST GROUSE

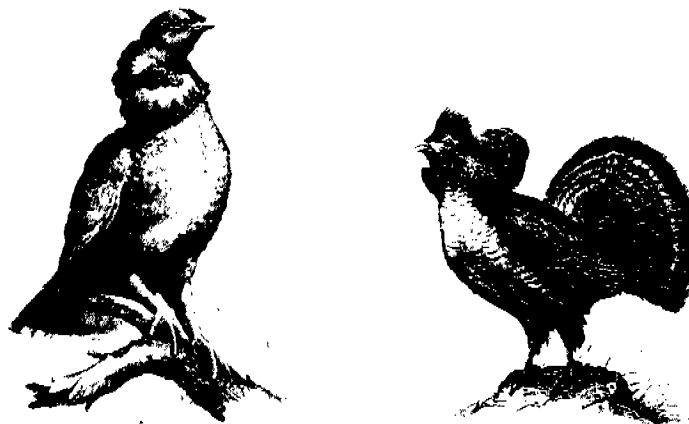

SUMMARY

Judging from harvest statistics for the fall of 1991, the 1992 breeding populations of blue and ruffed grouse were just below average. However, blue and ruffed grouse observed per 100 hours of effort during summer brood counts in 1992 increased 16 and 35 percent respectively.

Production of blue and ruffed grouse increased and decreased slightly from 1991. A total of 44 forest grouse broods were observed during 1992 compared with 51 in 1991, 59 in 1990 and 46 in 1989.

Total harvest increased from 34,897 in 1991 to 44,518 in 1992, a 20 percent increase. Total hunters and days afield also increased.

These data indicate that hunters are discovering forest grouse hunting and are using the resources more than 10 years ago.

Brood Counts

Ruffed Grouse

Results of the annual random brood survey for 1992 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and ruffed grouse observed per 100 hours are found in Tables 2-4. A summary of effort expended on ruffed and blue grouse brood counts combined is shown in Table 9. Survey results for 1992 compared to 1991 and the previous 10-year average (1982-1991) follow:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Total ruffed grouse observed	56	+2	-41
Young per 100 adults	273	-15	-13
Mean brood size	4.10	+2	-3
Ruffed grouse observed per 100 hours	31	+35	-14
Total hours effort	181	-23	-38

Harvest statistics for 1991 indicated a below average breeding population for 1992.

Effort on brood surveys decreased by 23 percent and was 38 percent below average.

Grouse observed per 100 hours was 14 percent below average, while mean brood size was 3 percent below average indicating decreased production.

Blue Grouse

Results of the annual random brood survey for 1992 are shown in Table 5 of this section. Long-term trends of young per adult ratios, mean brood size and blue grouse observed per 100 hours are found in Tables 6-8. Survey results for 1992 compared to 1991 and the previous 10-year average (1982-91) follow:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Total blue grouse observed	216	-18	-45
Young per 100 adults	243	+2	0
Mean brood size	4.29	+11	+15
Blue grouse observed per 100 hours	130	+16	+19
Total hours effort (forest grouse)	166	-30	-55

Harvest statistics for 1991 indicated the blue grouse breeding population for 1992 was below average.

The 1992 summer surveys on blue grouse indicated that production increased (2 percent) from 1991 and was about average.

Total observations decreased 18 percent, with a 30 percent decrease in effort. The number of grouse observed per 100 hours of effort increased from 1991 and was 19 percent above average.

Harvest

Hunter Questionnaire

Results of the 1992 blue grouse, ruffed grouse and combined hunter questionnaire are shown in Table 10, 11 and 12 respectively. Long-term trends of forest grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 13-15 and total statewide harvest statistics in Table 16 and Figures 1 and 2. Forest grouse season length, bag limits and harvest statistics, 1963-1992 are listed in Table 17. Harvest statistics for 1992 compared to 1991 and the previous 29-year average follow:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Forest grouse hunters	15,000	+14	+2
Forest grouse harvested	44,518	+28	+25
Hunter-days afield	46,136	+9	+26
Forest grouse per hunter-day	0.96	+17	-1
Forest grouse per hunter	2.97	+23	+29
Percent ruffed grouse	33.73	-2	-13
Percent blue grouse	65.47	+7	+19
Percent unidentified	0.80	-82	-87

Total harvest increased 28 percent from 1991 and was 25 percent above average. Overall, hunter success (grouse per hunter-day) was 26 percent above average and the number of grouse harvested per hunter was 29 percent above average. Hunter pressure increased slightly and was still 2 percent above the 29-year average.

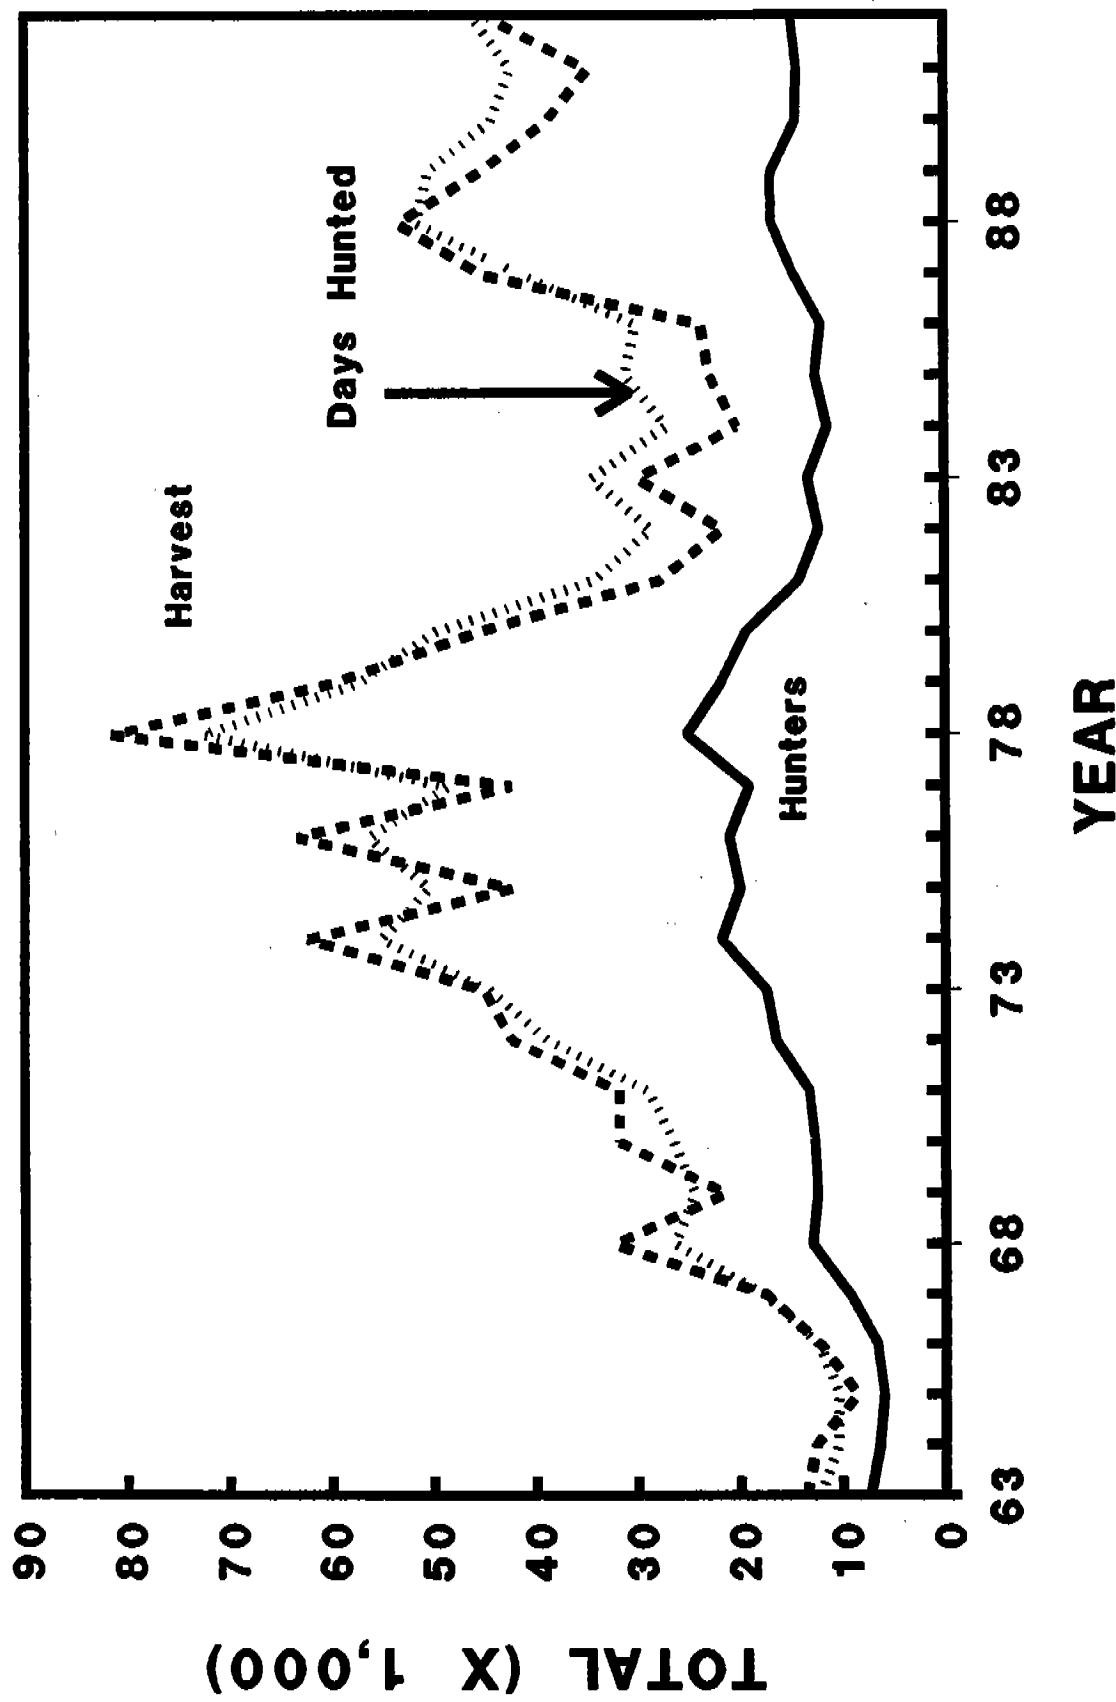

Figure 1. Statewide trends of forest grouse harvest statistics, 1963-92.

FOREST GROUSE PER HUNTER AND DAY

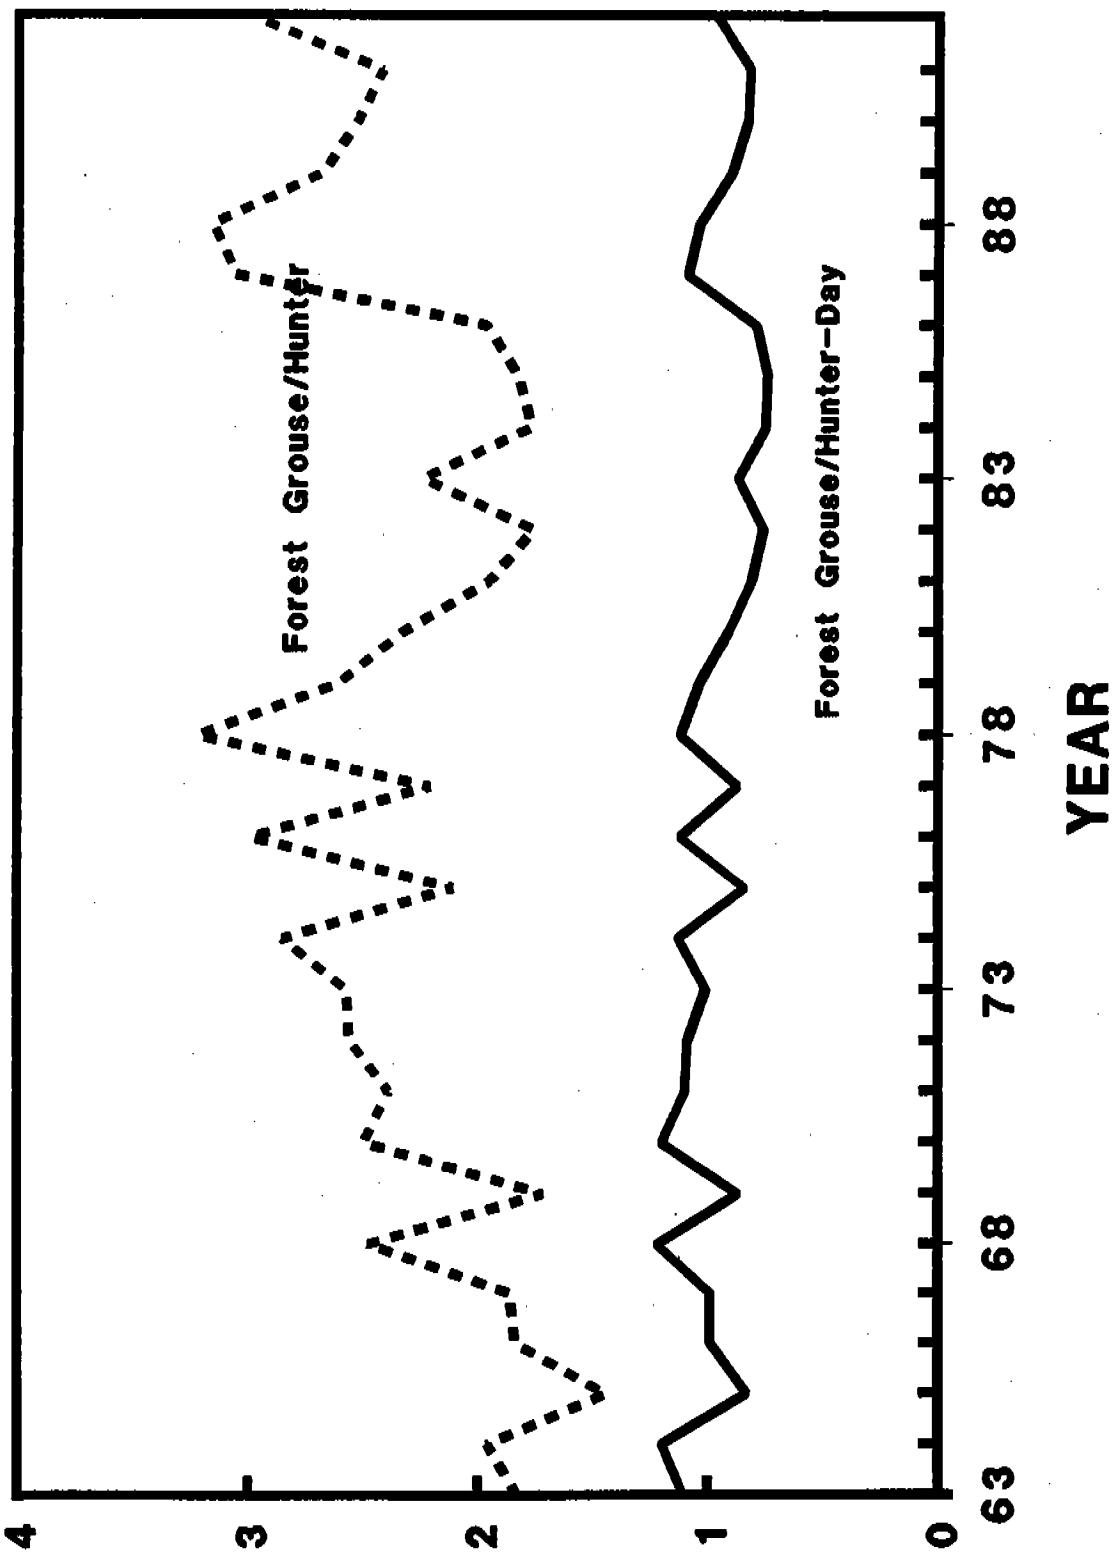

Figure 2. Statewide trends of forest grouse hunter success rates, 1963-92.

Field Bag Checks

A summary of field bag check data for 1992 is found in Table 18. Hunter success trends determined via this method are shown in Table 19. Sex and age composition of the harvest as determined from wings is shown in Table 20 and 21. Results of the 1992 survey compared to 1991 and the previous 10-year (1982-91) average follow:

	<u>1992</u>	<u>Percent change from 1991</u>	<u>Average</u>
Total hunters checked	341	-35	-47
Total hours hunted	289	-64	-88
Forest grouse per hunter (complete hunts)	0.74	+48	+11
Forest grouse bagged per 100 hours	87	+172	+368
Average hours per hunter-day (complete hunts)	0.85	-45	-77
Hours hunted per grouse bagged (complete hunts)	1.12	-64	-81

There was a substantial decrease in numbers of hunters checked in 1992. Hunter success (grouse per hunter) increased 48 percent from 1991 and was 11 percent above average.

* Season opener changed to the second Saturday in September from the third Saturday in September.

** From 1950 to 1963 a grouse stamp was required to hunt any grouse. In 1964, the entire state was opened to hunting without a stamp.

QUAIL

SUMMARY

Production of Gambel's quail decreased slightly from 1991. Production statewide decreased in 1992, but remained above average.

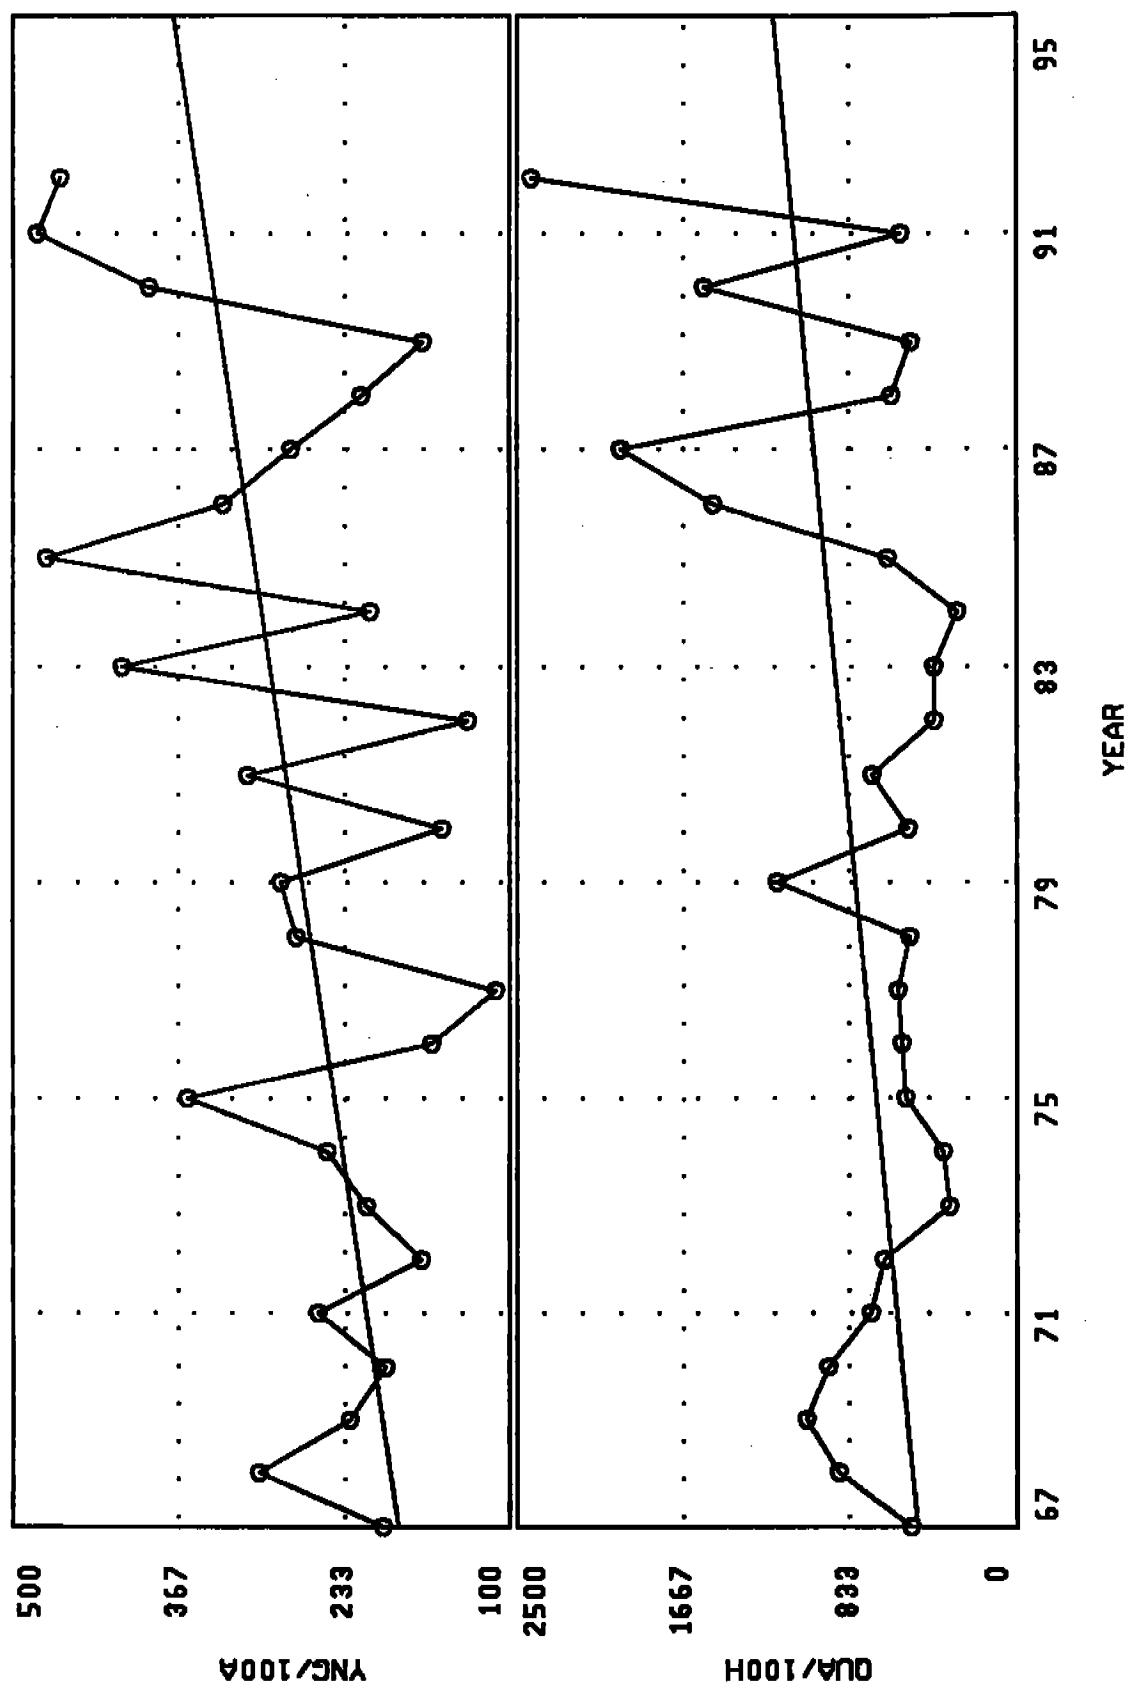

Statewide harvest statistics, when compared to 1991, showed an increase in total hunters and in total harvest. Hunter success (birds per hunter-day) increased 8 percent and remained below average statewide. Hunter-days afield increased 9 percent from 1991. Total harvest of Gambel's quail reported in Washington County decreased significantly.

There has been a long-term decline in hunter success and total harvest in Washington County; however, there has been an increase in production trend indices. Given the extensive urban development in the St. George-Hurricane areas since 1962, the decline in total harvest and hunter success is only partly attributable to habitat loss. There are areas that sustain quail populations that cannot be hunted because of urban expansion (i.e. Bloomington, Bloomington East, Santa Clara River below Santa Clara, north of St. George). These were popular hunting areas in the early 1960's (D. Nish personal communication).

FIGURE 1. QUAIL PRODUCTION INDICES, 1967-92.

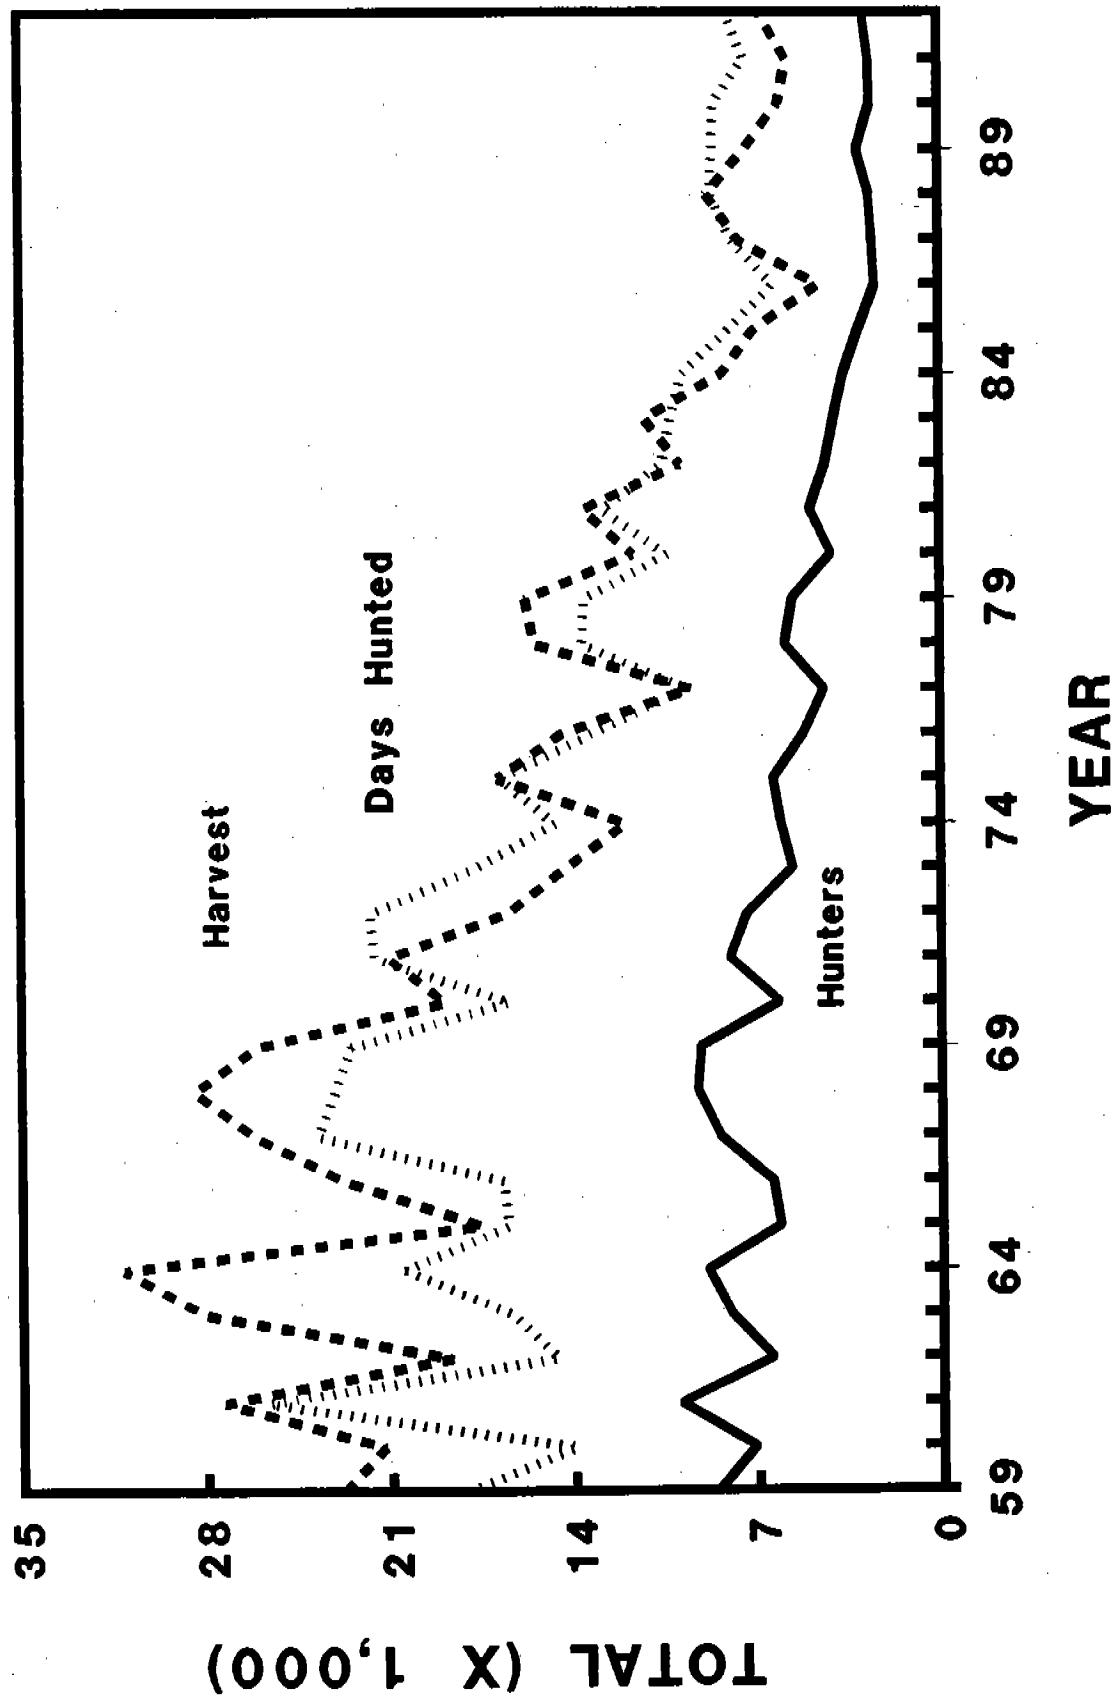

Figure 2. Statewide trends of quail harvest statistics, 1959-92.

Brood Counts

Results of the annual random brood counts for California quail for 1992 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and quail observed per 100 hours are shown in Tables 2-4 and Figure 1. Gambel's quail long period waterhole count trends are in Table 10. Survey results for 1992 compared to 1991 and the previous 10-year (1982-91) average follow:

	<u>1992</u>	<u>Percent change from 1991</u>	<u>Average</u>
Total quail observed	73	+152	-76
Young per 100 adults	462	-4	+49
Mean brood size	7.50	-17	+1
Quail observed per 100 hours	2,433	+319	+184
Total hours effort	3	-40	-93

Harvest statistics for 1991 indicated an increased breeding population of quail statewide.

Brood count effort decreased in 1992 due to Division specialization of conservation officer and biologist duties and no staffing of additional biologists under reorganization. Only 73 quail were observed in 1992 which was 76 percent below average. Total hours of effort on California quail brood counts was 3 which is 93 percent below average for the last 10 years. The production index of young per 100 adults for Gambel's quail was 45 percent lower than what it was the previous year. Production statewide remained above average.

Harvest

Results of the annual hunter questionnaire for 1992 are shown in Table 5. Long-term trends of quail bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8, and total statewide harvest statistics in Table 9.

Comparison of the 1992 season to 1991 and the previous 33-year average follow:

	<u>1992</u>	<u>Percent change from 1991</u>	<u>Average</u>
Quail hunters	2,861	+8	-48
Quail harvested	6,788	+18	-55
Hunter-days afield	8,068	+9	-41
Quail per hunter-day	0.84	+8	-21
Quail per hunter	2.37	+9	-10

Harvest for 1992 increased 18 percent from 1991 and was 55 percent below average.

In Washington County (Gambel's quail), hunter success increased 24 percent and hunter days afield increased 62 percent from 1991. Total harvest decreased 53 percent. Fourteen percent of the statewide harvest of quail was taken in Washington County during 1992 compared to 35 percent in 1991, 18 percent in 1990.

Long-term quail harvest statistics are shown in Figures 2 and 3.

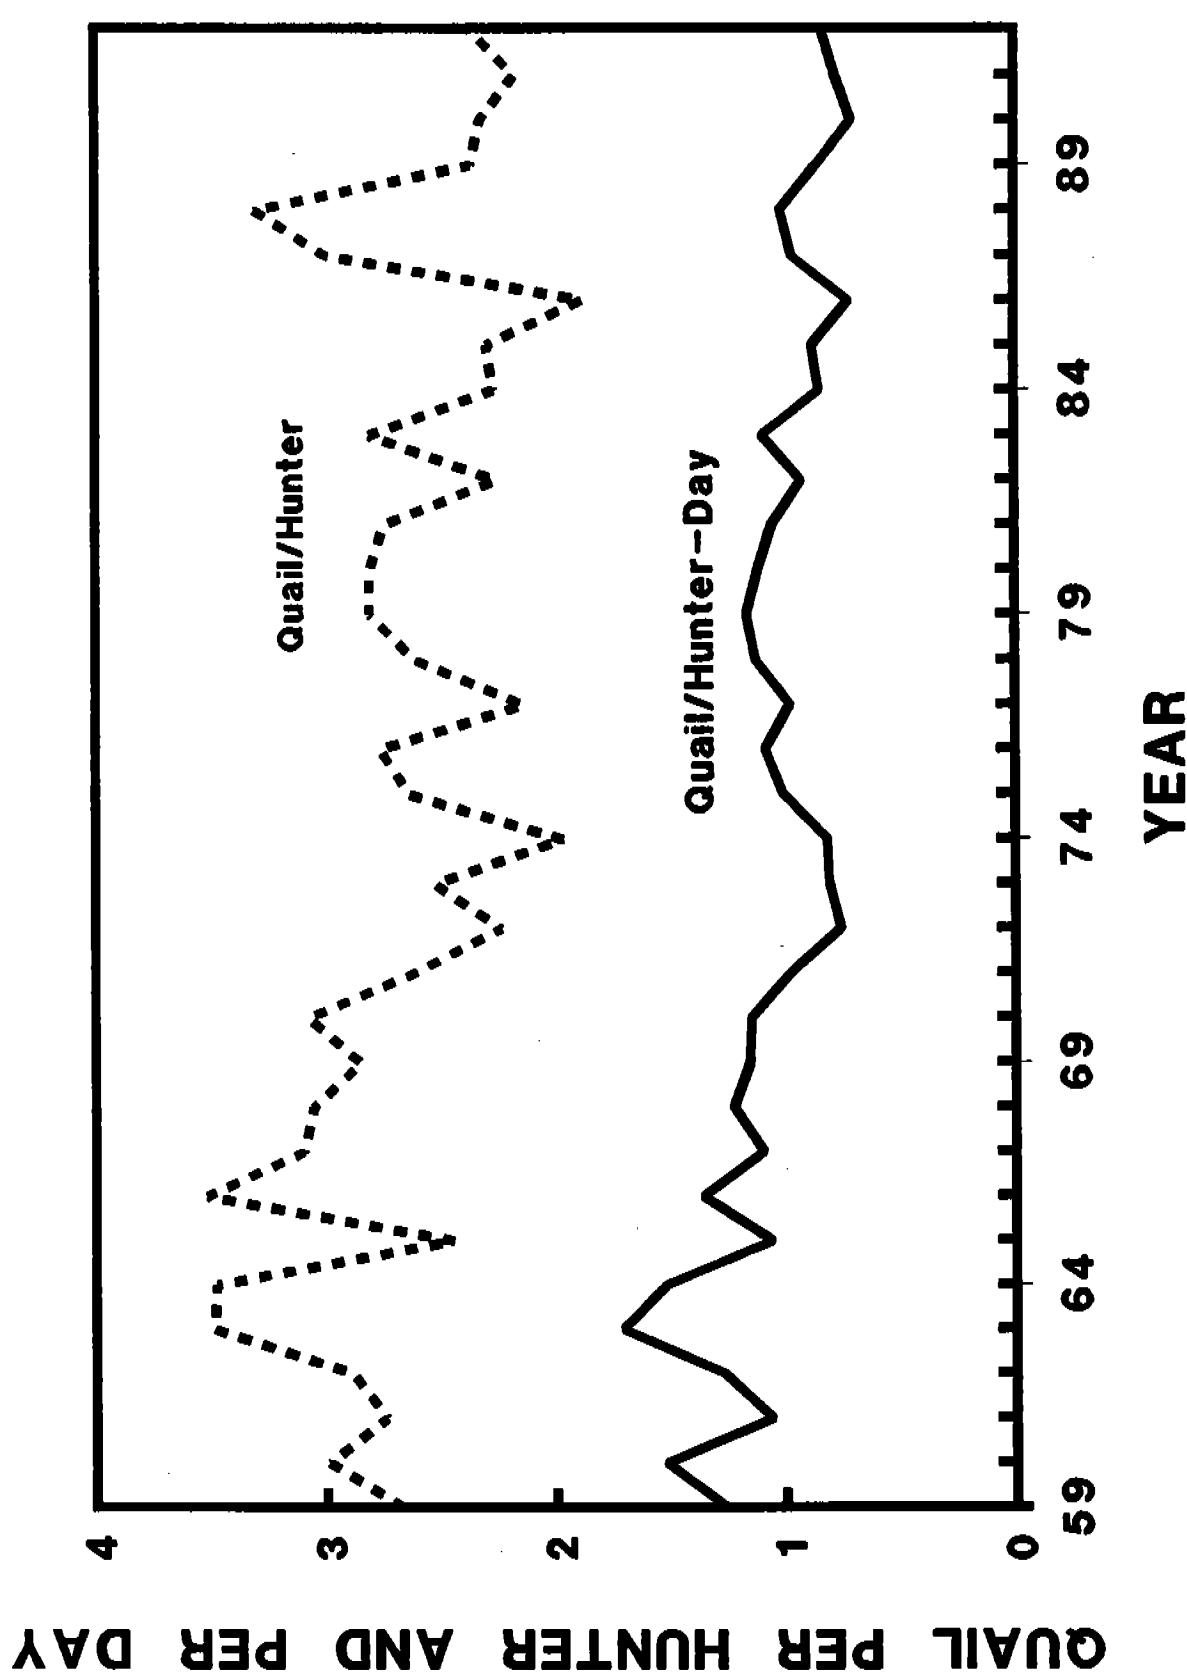

Figure 3. Statewide trends of quail hunter success rates, 1959-92.

HUNGARIAN PARTRIDGE

SUMMARY

Harvest data for 1991 indicated above average breeding populations for 1992. Limited brood data was collected in Box Elder and Juab counties and indicated a slight decrease in Hun production.

The 1992 hunt data indicated decreased hunting pressure on Huns when compared to 1991. The number of Huns harvested increased 2 percent in 1992. Hunters afield increased 20 percent. Total hunters, days afield and harvest remain just below the long-term average.

We expected continued improvement in Hungarian partridge populations in Box Elder County due to the large quantity of agricultural land set aside in the Conservation Reserve Program. We believe that increases in hunter success since 1985 reflect increased partridge populations as a direct result of CRP. Exceptions (declines) in 1988 and 1989 were probably due to drought. The decline in production and harvest in 1989 was possibly due to the hot, dry summer.

S

Brood Counts

Results of the annual random brood counts for 1992 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and Huns observed per 100 hours are shown in Tables 2-4. Results of the survey for 1992 compared to 1991 and the previous 10-year (1982-91) average follow:

		<u>Percent change from 1991</u>	<u>Average</u>
Total Huns observed	100	-25	+17
Young per 100 adults	567	-28	+21
Mean brood size	8.83	-29	-14
Huns observed per 100 hours	118	-64	-54
Total hours effort	85	+107	+108

Harvest data for 1991 indicated an above average breeding population for 1992. Young per 100 adults decreased 28 percent from the previous year, but was 21 percent above average. Hours of effort increased 107 percent from 1991, but only 6 broods were observed.

Harvest

Hunter Questionnaire

Results of the annual hunter questionnaire for 1992 are shown in Table 5. Long-term trends of Huns bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. The 1992 season compared to 1991 and the previous 33-year average follow:

		<u>Percent change from 1991</u>	<u>Average</u>
Hungarian partridge hunters	3,198	+20	-10
Hungarian partridge harvest	7,553	+2	-1
Hunter-days afield	8,192	-2	-8
Huns per hunter-day	0.92	+5	+12
Huns per hunter	2.36	-15	+15

Hungarian partridge hunters and hunting pressure increased. Success increased 5 percent from 1991. Harvest was 1 percent below the 33-year average.

Long-term Hun harvest statistics are shown in Figures 1 and 2.

Field Bag Checks

Results of the survey for 1992 are shown in Table 10. Hunter success trends determined via this method are shown in Table 11. Indices obtained for 1992 compared to 1991 and the previous 10-year (1982-91) average follow:

	<u>1992</u>	<u>Percent change from 1991</u>	<u>Average</u>
Total hunters checked	13	+18	-91
Total hours hunted	13	+18	-98
Huns per hunter (complete hunts)	0.69	+25	-61
Huns bagged per 100 hours	69	+25	+50
Average hours per hunter-day (complete hunts)	1.00	0	-78
Hours hunted per Hun bagged (complete hunts)	1.44	-21	-90

Field bag check data submitted in 1992 was for Box Elder and Rich counties only. Many of these hunters are hunting sagegrouse, but Huns are often found in the same areas. Sample sizes were too small to derive meaningful conclusions.

WILD TURKEY

SUMMARY

Merriam's Turkeys

Turkey populations remain fairly stable and well above the 23-year average. However, hunter success rates decreased slightly from 1991. The percent of hunters observing turkeys declined in 1992, but remains 9 percent above average. Merriam's populations appear to be down somewhat since 1984.

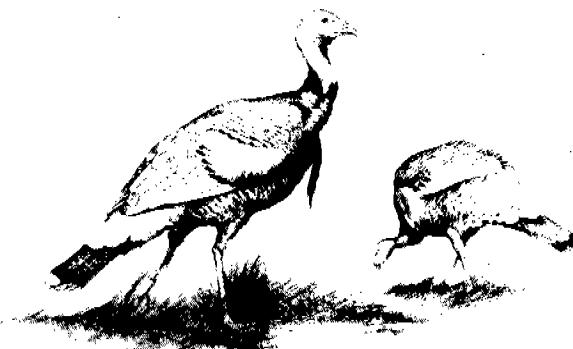

Hunter success and turkey observation data for the 1992 spring season indicated that the East Zion area had a slightly slower year than 1991. Total harvest and percent success decreased 11 and 16 percent respectively. Thirty-four birds were reported harvested for this unit. Harvest statistics indicate that the Boulder population decreased slightly while the LaSal population increased slightly. The remaining units of the state were closed to hunting. A fall turkey hunting season was not held anywhere in 1992.

Spring hunting pressure was down in 1992, but was well above average. Complaints about hunters interfering with each other due to over-crowding were made by 12 of 481 voluntary responses. Twenty-eight hunters complained about "no birds" or that the hunt was "poor." Twelve hunters suggested that the hunt is held "too late" in the spring. To reduce opening weekend pressure, the season opened Friday, May 1, rather than the Saturday nearest May 1.

Hunter success remained the same as the previous year, except 9 percent fewer hunters were afield. A total of 53 turkeys were harvested in the spring hunt of 1992 compared to 59 taken in 1991, 52 in 1990 and 59 in 1989. Observations of turkeys remained higher than average in 1992.

Rio Grande Turkeys

In 1992, Utah sportsmen were again given a limited entry opportunity to harvest Rio Grande turkeys. Four units were designated as limited entry for Rio Grande turkeys: 1) Marysvale, 2) New Harmony, 3) Pine Valley and 4) Tropic. Five permits were available for each unit with a \$25.00 permit fee required to participate in the hunt. Hunters were allowed to harvest 1 male bird. Three hundred twenty-three sportsmen applied for the 20 available permits. A random drawing was held to determine successful applicants. Odds for drawing in each area were as follows: 1) Marysvale 1:15, 2) New Harmony 1:26, 3) Pine Valley 1:13 and 4) Tropic 1:11.

S

For the first time in history, a Rio Grande wild turkey-bid permit was available. Minimum bid on the permit was \$350 January 15th through 8:00 p.m. March 7th, 1992. No one submitted the sealed minimum bid through March 7th so the permit was auctioned off to the highest bidder at the National Wild Turkey Federation Utah Chapter fund-raising banquet the night of March 7th. The permit sold for \$360. The successful bidder had his choice of the limited entry units to hunt and chose to hunt the New Harmony Unit.

Limited brood count data is exhibited in Table 5. Harvest statistics for the limited entry hunts are found in Table 6. Eighteen hunters averaged 3.20 days-afield each to harvest a total of 15 turkeys. Six of the harvested birds were yearlings and 9 were adults. Seventy-five percent of the hunters afield harvested a bird.

As other Rio Grande populations continue to grow throughout the state, more limited entry opportunities will be provided.

Harvest

Spring Merriam's Gobbler Season

Results of the 1992 spring season are shown in Table 1 of this section. The trend of these data since 1968 is shown in Table 2 and Figures 1 and 2. Specific harvest information is listed in Table 3. Statewide summary of fall hunt statistics is in Table 4. The 1992 spring season compared to 1991 and the previous 23-year average follow:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Permits sold	538	-8	+120
Hunters afield	484	-9	+119
Turkeys harvested	53	-10	+101
Hunter-days afield	1,599	-11	+148
Percent hunter success	11	0	-2
Turkeys bagged per hunter-day	0.03	0	-30
Percent of hunters who observed turkeys	45	-8	+9

Permit sales and hunters afield decreased slightly from 1991 but were well above average. Total harvest decreased (from 59 in 1991 to 53 in 1992), which is ten percent below the previous year. Hunter success rates remained the same from 1991 and were 2 percent below the 23-year average. The proportion of hunters who reported having observed turkeys was 9 percent above average. In 1992, the Boulder Unit accounted for 42% of the hunting pressure based on hunter-days afield. The East Zion unit accounted for 44% of the hunting pressure. However, the East Zion Unit accounted for 65% of the statewide harvest.

The trend of spring Merriam's turkey harvest statistics is shown in Figures 1 and 2. Six percent of the hunters used archery equipment, one hunter used a rifle and the remainder reported using shotguns. Four turkeys were reported crippled and not recovered. Six of 48 known kills were suspected of being females and another seven are suspected of being jakes.

Eighteen percent of the harvest (8 of 48) occurred on opening day (Friday), 23 percent the following day, 30 percent the first weekend and 11 percent the last weekend of the hunt. Forty-eight percent of the harvest occurred on weekends compared with 14 percent last year (1991), 25 percent in 1990 and 33 percent in 1989. It appears that opening the season on May 1 instead of Saturday nearest May 1, is doing what was intended by spreading harvest and pressure out over the season.

Twelve of 481 hunters commented that the spring hunting season should be opened 1-3 weeks earlier. Twelve commented that the hunt was too crowded. Turkey hunters were again questioned about interference from bear hunters using hounds during the 1992 hunt. Two of 481 hunters complained of interference. One hunter from the Boulder Mountain unit complained of interferences that occurred once. One hunter from the East Zion unit complained of a total of 5 interferences. Overall, interferences from bear hunters seems to be very insignificant.

(1964-84)	122	111	268	32	21	0.10	14	441	34

*Some hunter hunted more than one area or failed to designate areas hunted. This accounts for the difference between totals given above and combined tables of separate units in Tables 5, 6 and 7.

**During 1968, the Boulder Mountain and East Zion units had two-bird season limits and the LaSal Mountains a one-bird limit; from 1969 through 1972, all areas had a two-bird limit. Hunter success was based on the number of successful hunters rather than total turkeys bagged.

*** No fall season.

SHARP-TAILED GROUSE

SUMMARY

The Columbian sharp-tailed grouse is one of four species of grouse native to Utah. Sharp-tails were formerly abundant in the valley and foothill areas of northern and central Utah. Sharp-tailed grouse habitats were the most attractive areas for agricultural development and grazing. As a result, sharp-tail habitat was directly converted to farmland or was seriously impacted by heavy grazing.

There was no legal harvest of sharp-tailed grouse from 1980 through 1992. Since 1988, the number of birds present on active dancing grounds has been substantially greater than in recent years (Table 1.). In the last four years several "new" grounds have been located. It appears sharp-tailed grouse have made a moderate recovery in core areas. Numbers on the fringe of their range appear to be low. Concurrent with the upswing in sharp-tailed populations has been a succession of mild winters. Since the catastrophic winter of 1983-84, all winters have been normal or milder than normal except 1988-89.

In Box Elder County, habitat associated with existing populations of sharp-tailed grouse has been relatively unchanged since 1983 except that about 100,000 acres in Box Elder County have been entered into the Conservation Reserve Program (CRP). This may be benefitting sharp-tailed grouse populations by providing undisturbed nesting and brood-rearing cover. The value of CRP to wildlife in Utah is being studied.

We have minimal recent data on sharp-tailed grouse populations in the Cache, Weber, and Morgan County areas. By 1984, populations in these areas were at or below minimum viable population levels. Efforts have increased over the past three years to locate "new" dancing grounds in these counties (Table 1.). New "core" sharp-tailed grouse habitat areas are being attributed to CRP lands in these counties.

Sharp-tailed grouse brood count information for Box Elder County is shown in Table 2.

		Average Number of Grouse/Ground	10.40	11.30	4.70	1.50	3.40	2.10	2.50	2.50	14.00	11.30	6.70	7.00	43.00	13.00	13	

*High sagebrush precluded an accurate count--birds were counted when flushed.

Since visitation by females at any given time is low, an estimated 90% of the grouse seen on the ground are males.

Therefore, this figure is an estimate of the males on the ground.

A = ACTIVE

N/A = NOT ACTIVE

PTARMIGAN

SUMMARY

The white-tailed ptarmigan (*Lagopus leucurus*) was introduced into the Uinta Mountains of northeastern Utah in 1976 with the release of birds captured in Colorado. The initial transplant consisted of 22 paired birds released in June 1976. A second release of 35 mixed young and adults was accomplished in September of that same year.

Breeding Territory and Brood Surveys

Surveys on the ptarmigan population continue, as time and manpower constraints allow. Two survey techniques are used. A breeding territory survey is conducted from mid- to late June. A brood survey is conducted from mid- to late August. Results of the last 10 and 11 years of survey data are found in Tables 1 and 2.

No spring survey of breeding territories and no summer brood survey was made in 1992.

Harvest

Seventeen hunters bought \$3.00 permits to hunt ptarmigan in Utah in 1992 (Table 3). An estimated 11 hunters actually pursued ptarmigan and no birds were killed. However, thirty-six percent of the hunters afield reported observing ptarmigan.

Many permits are obtained by sportsmen who think they might hunt during a fishing or big game hunting trip, but don't seriously plan on the ptarmigan hunt.

 Projection Factor = 1.33 (17 permits issued/15 questionnaires returned).

RABBITS AND HARES

SUMMARY

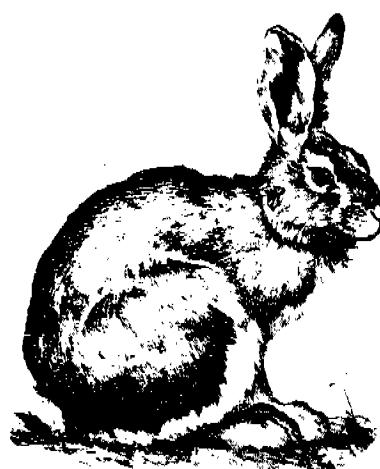

Cottontail Rabbits

Cottontail populations remain below a short term high in 1988.

Summer roadside counts indicated an increased population density statewide. Harvest statistics indicated increased hunter success and is still 6 percent below average. Many hunters expressed seeing numerous cottontail while afield.

Snowshoe Hares

The 1992 snowshoe hare hunting season indicated an increase in populations.

Hunter numbers increased 9 percent from the previous year and remained below average. Although efforts have been made to educate hunters in the identification of the snowshoe hare and the white-tailed jackrabbit, it is still a potential problem which could bias the snowshoe data.

It appears that in 1992 there was an increased interest in snowshoe hare hunting opportunity.

COTTONTAIL RABBIT

Roadside Counts

Results of the annual roadside counts for 1992 are shown in Table 1 and Figure 1. The long-term trend of cottontails observed per mile and young per 100 adults is shown in Figure 4 and Tables 2 and 3. Indices for 1992 compared to 1991 and the previous 10-year (1982-91) average follow:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Total miles driven	857	+54	-37
Total cottontails counted	207	+120	-56
Cottontails observed per mile	0.24	+41	-28
Young observed per 100 adults	71	+11	-7

Production data from roadside counts indicated an increase in the population. The cottontail per mile index increased 41 percent and was 28 percent below average.

Harvest

Hunter Questionnaire

Results of the 1992 hunter questionnaire are found in Table 4. Trends of cottontails bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 5-7. Trends of statewide harvest statistics are found in Table 8 and Figures 2 and 3. Results of the 1991 season compared to 1991 and the 25-year average follow:

		<u>Percent change from</u>	
	<u>1992</u>	<u>1991</u>	<u>Average</u>
Cottontail hunters	20,509	-3	-17
Cottontail harvest	117,454	+5	-26
Hunter-days afield	83,154	0	-18
Cottontails per hunter-day	1.41	+4	-6
Cottontails per hunter	5.73	+9	-7

Total hunters decreased 3 percent from 1991. However, effort remained the same. Total harvest decreased 5 percent. Total harvest was 26 percent below average. Hunter success was 6 percent below average. Harvest data indicate a year of below average populations of cottontails. The drought may be negatively affecting rabbit populations statewide. A population crash was apparent in the spring of 1984, and has been confirmed by the 1984 and 1985 harvest data. Populations recovered rapidly in 1986, 1987, and 1988. Populations may be headed downward again. The last seven winters have not been harsh.

Field Bag Checks

Results of field bag checks for 1992 are shown in Table 9. Trends of hunter success as determined by bag checks are shown in Table 10. Following is a comparison of the 1992 field bag check data to 1991 and the previous 10-year (1982-91) average.

	<u>1992</u>	<u>Percent change from 1991</u>	<u>Average</u>
Total hunters checked	4	-98	-97
Total hours hunted	10	-99	-97
Cottontails per hunter (complete hunts)	1.25	-1	-42
Cottontails bagged per 100 hours	50	+72	-31
Hours per hunter-day (complete hunts)	2.50	-42	-20
Hours per cottontail bagged (complete hunts)	0.05	-99	-98

Sample sizes were so small that no meaningful conclusions can be drawn.

SNOWSHOE HARE

Harvest

Results of the 1992 hunter questionnaire are found in Table 11. Trends of snowshoe hares bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) are found in Tables 12-14. Trend in statewide harvest statistics by year are shown in Table 15 and Figures 1 and 2. The 1992 season compared to 1991 and the 17-year average follow:

	<u>1992</u>	<u>Percent change from 1991</u>	<u>Average</u>
Snowshoe hare hunters	3,732	+9	-26
Snowshoe hares harvested	7,144	+51	-31
Hunter-days afield	11,836	+1	-20
Snowshoes per hunter-day	0.60	+50	-7
Snowshoes per hunter	1.91	+38	0

Significant misidentification of white-tailed jackrabbits as snowshoe hares was anticipated prior to mailing the harvest questionnaire following the first season in 1975. This proved to be the case as a significant harvest of snowshoe hares was reported for counties outside the known range of the species. It was assumed that the problem was statewide, not just confined to those counties. Several attempts were made in the 1970's to reduce misidentification through pictures and descriptions in leaflets and questionnaires.

Beginning in 1988, harvest questionnaires, and in 1989 the Upland Game Proclamation had drawings and descriptions of the various rabbits in an attempt to reduce misidentification. We believe this has been successful.

Results of the 1992 harvest questionnaire indicates a 50 percent increase in hunter success compared to 1991. Success was below the 17-year average, even though hunters spent slightly more time afield in 1992.

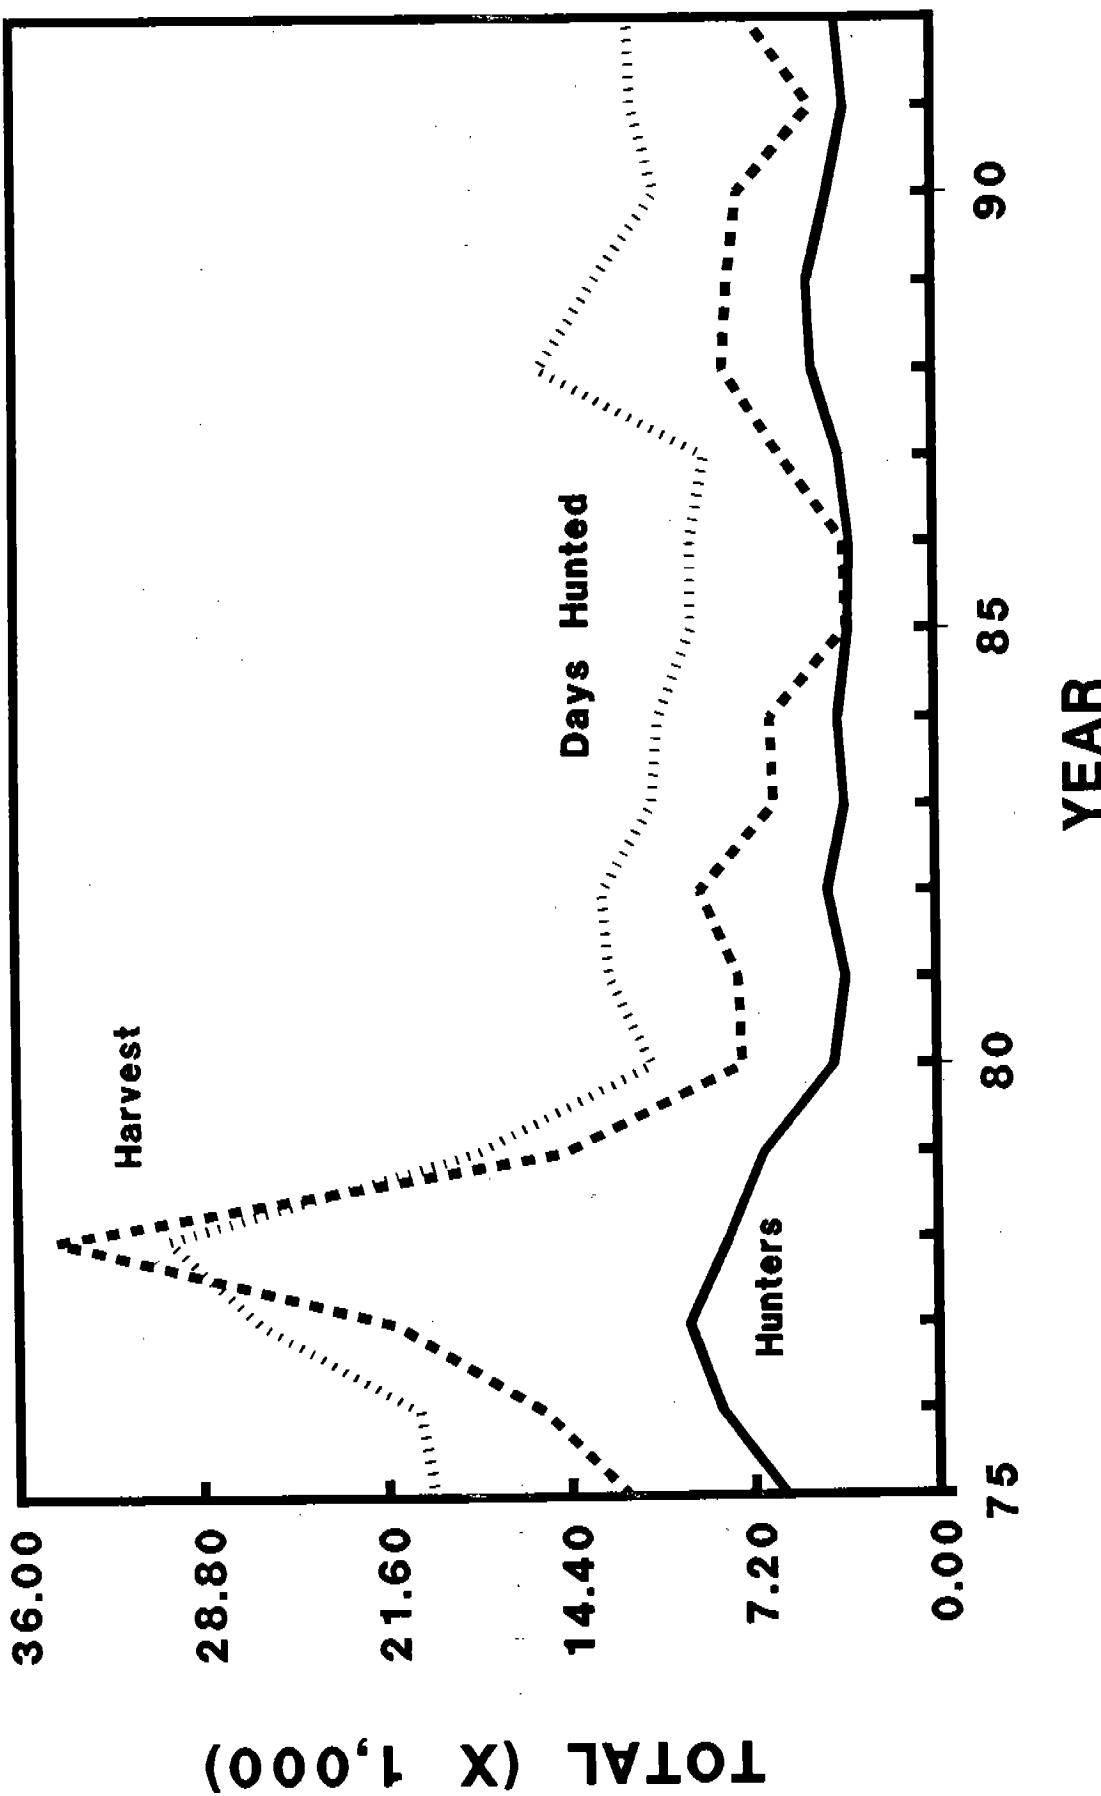

Figure 1. Statewide trends of snowshoe hare harvest statistics, 1975-92.

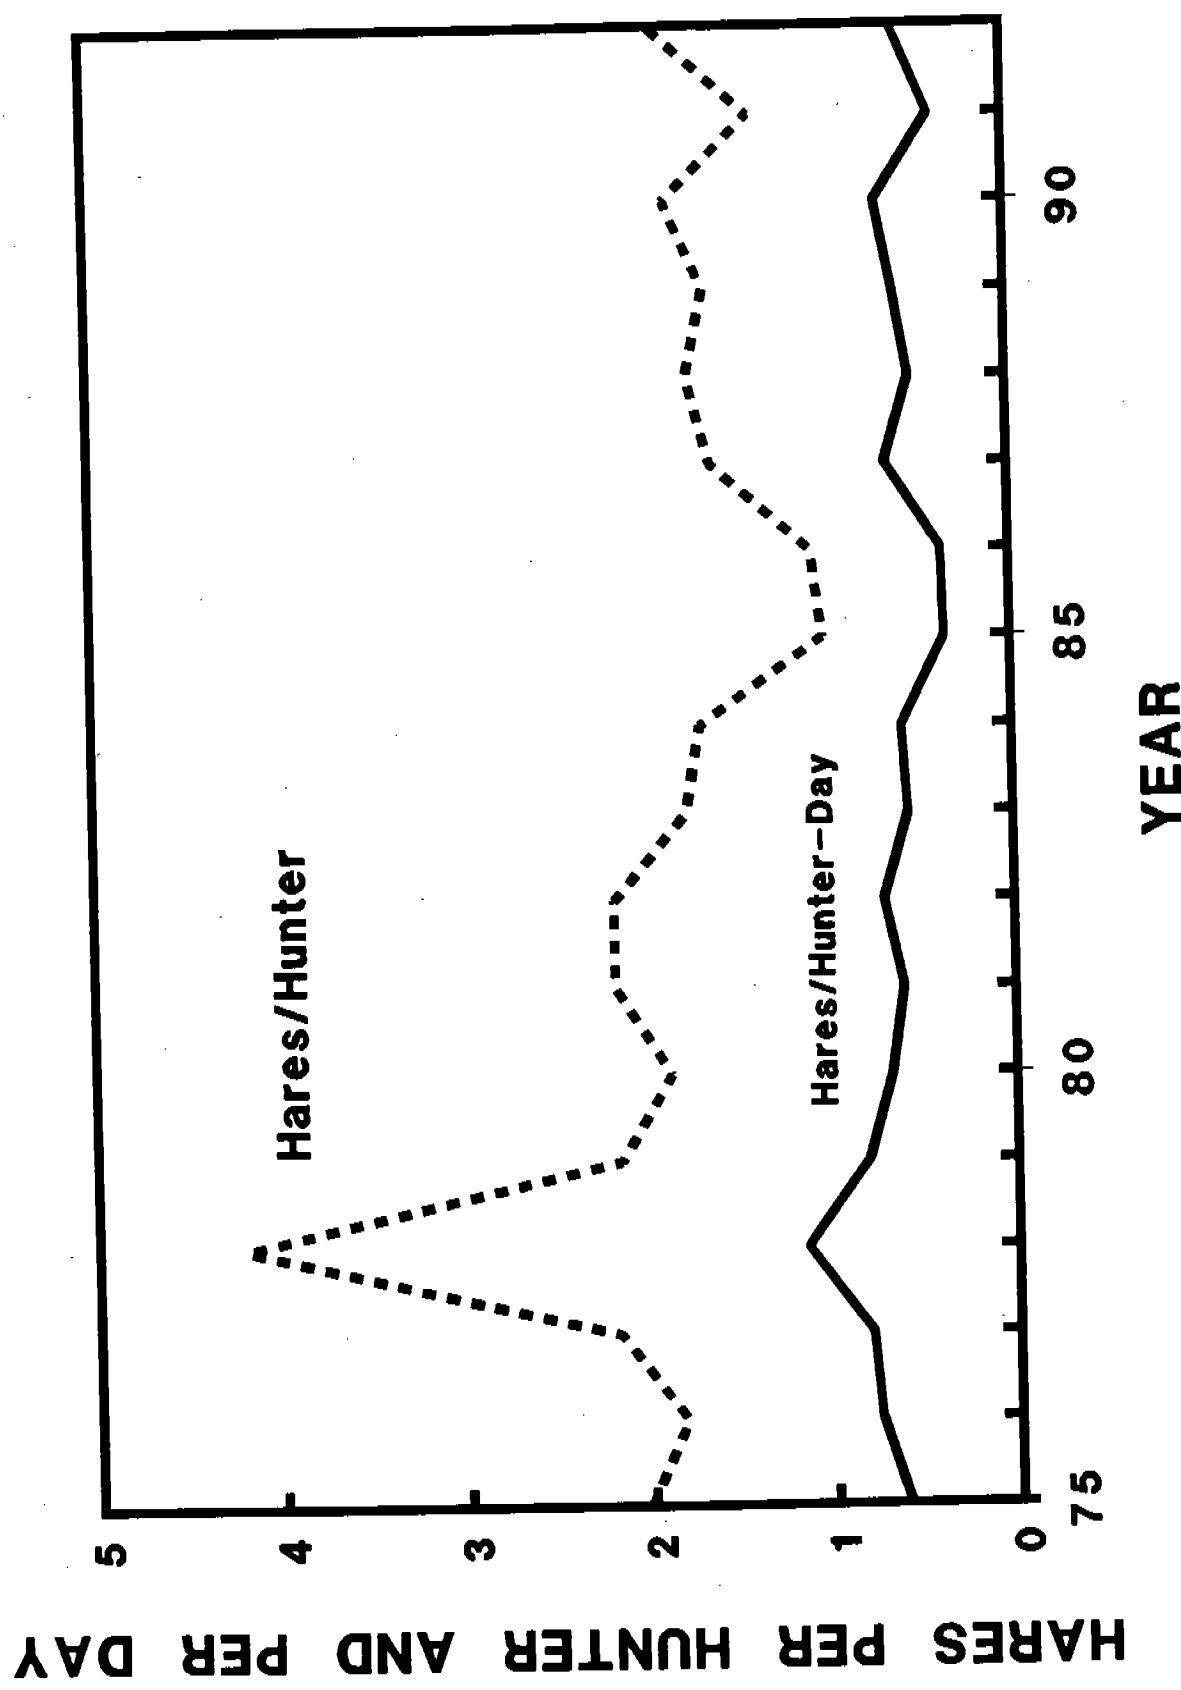

Figure 2. Statewide trends of snowshoe hare hunter success rates, 1975-92.

Table 11. Summary of snowshoe hare hunter success and distribution of harvest and hunting pressure by region and county, 1992.

APPENDIX A

WEATHER CONDITIONS

Weather information used in this report (Tables 1 & 2 and Figures 1 & 2) is from the office of the Utah State Climatologist and N.O.A.A. Climatological Data Periodical.

The 1991-92 winter weather was relatively mild in terms of precipitation and in terms of cold temperature. Below average precipitation fell between December 1991 and January 1992. October 1991 through January 1992 temperatures were below average.

In the spring of 1992, March, May and July precipitation was above normal, temperatures were above normal February through June, while April and June precipitation was below normal across the state. Temperatures were above normal February through June.

Table 1. Comparison of 1992 monthly average temperatures (F) to the normal for each weather division and statewide.

APPENDIX B

LICENSE SALES

Small game license sales by type and cost are listed in Table 1. The number of licenses sold for all types decreased slightly in 1992.

The proportion of Utah's population hunting small game is declining (Table 2). In the early 1970's about 10 percent of Utah's population was hunting small game. By 2000, we project that only about 6 percent will be hunting small game.

Table 3 identifies revenue generated to the Utah Division of Wildlife Resources from small game license sales. Small game program budgets run about half the revenue generated, with the other half going to support services such as law enforcement, administration, accounting, and field services.

Table 1. Statewide small game license sales information, 1954-92.

Year	Adult Res.		Juv. Res.		Non Res.		Combination Issued	License Cost

1 Value does not include NRSG revenue--this is assumed to be primarily non-resident bear and cougar hunters.
It does not include NRSG revenue.

2 Combination license values are based on the assumption that all waterfowl hunters purchased only combination licenses. They may fish and hunt big game but they do not hunt any other small game. Therefore, duck stamp sales are subtracted from combination license sales when projecting revenue generated. The proportion of the combination license fee attributed to small game equals the resident small game license fee divided by the resident fishing license, plus the resident big game license fee, plus the resident small game license fee or \$9.33 for 1992.

3 Total Federal duck stamps sold does not include those sold during the second quarter, April-June, because persons purchasing stamps during this quarter tend not to be hunters.

4 Half of the juvenile small game license sales were attributed to waterfowl hunters. Federal duck stamps are not required of juveniles less than 16 years of age.

APPENDIX C: Regional and statewide summary of effort expended on upland game summer surveys.

Generally hours spent and miles driven on upland game surveys in Utah have declined since 1971. This is the result of competing uses of time for biologists and conservation officers. In addition, the restriction to a 40 hour work week by the Federal Fair Labor and Standards Act has further eroded survey effort. When effort and results have reached a lower critical sample size, surveys have been eliminated.

Table 1. Regional and statewide summary of effort expended on upland game summer inventory, 1971-92.
