Project Title: Statewide Wildlife Management Inventory

Project No. W-65-R-D-25

Job Title: Statewide Upland Game Inventory and Management

Job No. A-4

Period Covered: January 1, 1977 to June 30, 1978

Abstract: This report includes upland game inventory and harvest data relating to the 1977-78 hunting seasons. Results of annual inventory and harvest surveys and long-term trends of indexes derived by each method are included. Data obtained in 1977 are compared to 1976 and long-term averages.

Objectives: To conduct annual inventories and determine the population trend and annual harvest of upland game.

Procedures: Annual inventory procedures for ring-necked pheasants included winter sex-ratio counts and summer roadside counts. The winter sex-ratio counts were conducted from December 15, 1976, through February 10, 1977, as snow cover conditions allowed. Indexes derived include hen-cock ratios and pheasants observed per 100 hours. Annual summer roadside counts (three or more per route) were conducted from July 22 - August 3 on permanently established routes. Indexes derived include pheasants per mile, young per mile, young per hen, mean brood and percent of hens with young.

Mourning dove breeding population trend was determined via the annual call-count survey. This survey is part of a nation-wide survey administered by the Fish and Wildlife Service. Call-counts are conducted over 15 permanent, 20-mile routes. One count was made on each route between May 20-30.

Random brood counts were conducted on chukar and Hungarian partridge, forest grouse (ruffed and blue), sage grouse, wild turkey and quail from July 10 - August 5. Indexes derived for each species include mean brood size, young per 100 adults and birds observed per 100 hours effort.

Sage grouse strutting ground counts were conducted from March 15-May 15. Total cocks counted, average cocks per ground and percent change from 1976 for comparable grounds were determined on a county basis.

One Gambel's quail call-count route was run in Washington County in late April and early May. Long-period waterhole counts were completed in July and August.

Cottontail rabbit roadside counts were conducted over pre-established routes between July 15 and August 5. Indexes derived include rabbits per mile and young per 100 adults.

Separate harvest questionnaires were used to determine the harvest of upland game birds, cottontail rabbit and snowshoe hare, band-tailed pigeon and wild turkey. An approximate 20 percent sample of eligible licensees from the previous year (1976) license file was selected for the game bird questionnaire and a 12 percent sample for the rabbit and hare questionnaire. Questionnaires were mailed to all band-tailed pigeon and wild turkey permittees. Indexes derived included total hunters, hunter-days and harvest plus hunter success per day and for each season.

The game bird and rabbit and hare questionnaires were analyzed by the University of Utah Computer Center. Wild turkey and band-tailed pigeon questionnaires were analyzed by Game Management Section personnel.

Field bag checks of upland game hunters were made at random or at checking stations during each hunting season. Indexes derived include bag per hunter (per day), bag per 100 hours, average hours per hunter-day and average hours per bird bagged. Additional sex and age composition data were compiled for some species.

**Recommendations:** This project should be continued for the purpose of determining trends of upland game populations and harvest statistics in Utah.

# INTRODUCTION

The objective of Utah's upland game management program is to provide recreational hunting opportunity for sportsmen within the limits of the annual harvestable surplus for each species. It is based on the knowledge that populations of upland game experience relatively high rates of annual turnover. High reproductive rates are naturally compensated for by high death rates, whether hunting is allowed or not. Annual surveys are conducted to measure the production, trend and harvest of each upland game population hunted.

This is the seventh edition of this annual Upland Game Report. It is a consolidation of, and annual performance report for, information compiled during inventory and harvest surveys conducted under Federal Aid Project, W-65-R, Job A-4. Information contained herein was compiled by conservation officers, biologists and game managers of the Division of Wildlife Resources.

This report serves as a handbook of inventory and harvest data. It is designed primarily for the use of those concerned with the management of upland game in Utah. A separate section is devoted to each form of upland game hunted in Utah. Data is presented primarily in tabular form with limited narrative comment. The first page of each section provides a brief summary of population status and trend as indicated by inventory and harvest data.

During 1977, a total of 89,593 Utah sportsmen spent 593,626 days afield in pursuit of various upland game species. The harvest of upland game totaled 819,065. The proportion of the total upland game hunters which pursued each species is shown in Appendix Table 3 and the percentage failing to bag at least one bird of each species in Appendix Table 4. The framework for 1977 upland game hunting seasons is shown in Appendix Table 6. Harvest Statistics by species were as follows:

Species	Hunters Afield	Total Harvest	Hunter Days	Bag/ Hunter-day	Bag/Hunter For Season
Pheasant	67,195	148,168	191,142	0.78	2.21
Mourning dove	26,905	267,487	83,218	3.21	9.94
Chukar partridge	12,691	34,155	38,873	0.88	2.69
Sage grouse	14,078	18,615	25,759	0.72	1.32
Forest grouse	19,188	42,476	48,746	0.87	2.21
Quail	4,446	9,496	9,646	0.98	2.14
Hungarian partridge	3,557	6,360	9,058	0.70	1.79
Wild turkey					
spring	99	12	248	0.05	0.12
fall	53	7	133	0.06	0.13
Band-tailed pigeon	47	302	151	2.00	6.40
Cottontail	35,831	269,263	157,257	1.71	7.51
Snowshoe hare	9,752	21,232	26,532	0.80	2.18

Total hunters afield for all species of upland game = 89,593

A total of 23,487 upland game bird questionnaires were mailed. Of this number 2,513 (10.7 percent) were non-deliverable due to address deficiencies. Of the 20,984 delivered questionnaires, 9,329 (44.5 percent) were returned. Of those returned, 1,230 (13.2 percent) did not purchase a license during 1977. Usable returns, hunts plus no hunts, totaled 8,099. When combined with a total 122,062 eligible licensees a projection factor of 15.073104 resulted.

Rabbit and hare questionnaires were mailed to 15,213 sportsmen. Of these, 1,518 (10.0 percent) were non-deliverable, resulting in 13,695 delivered questionnaires. A return of 4,610 (29.1 percent) questionnaires was achieved. Of this number, 567 (12.3 percent) did not purchase a 1977 hunting license. Usable returns, hunts plus no hunts, totaled 4,043. When combined with a total 122,062 eligible licenses, a projection factor of 30.288337 resulted.

The 1977 weather year was extremely variable and ran from one extreme to the other. Following the severely dry fourth quarter of 1976, the first four months of 1977 also recorded well below normal precipitation. This dry period resulted in critical moisture conditions for all areas of the state. Precipitation during May reversed this trend with near record totals recorded at many stations. June was again quite dry but the remainder of the summer provided above normal moisture in most parts of the state. The final quarter of the year was again below normal for most areas of the state.

Temperatures during 1977 also showed wide variation. Average temperatures for January were below normal statewide except the Uinta Basin area. During February, the state recorded above normal temperature values but in March, temperatures again dropped to below normal. April temperatures rose to above normal followed by below normal values in May, values much above in June, variable in July and August then well above normal during the last four months of the year. June and December temperatures averaged 5 degrees above normal statewide with December being the warmest on record for some areas. The 1977 year did accumulate heavy snowpack in the mountains during the early winter months; providing good promise for ground water recharge and water storage for the 1978 growing season.

Conditions for game bird nesting were generally poor during May with below average temperatures and much above average precipitation statewide. Nesting conditions for late nesting species and for renesting improved during June.

Based on weather summary for 1977 prepared by E. Arlo Richardson, State Climatologist)

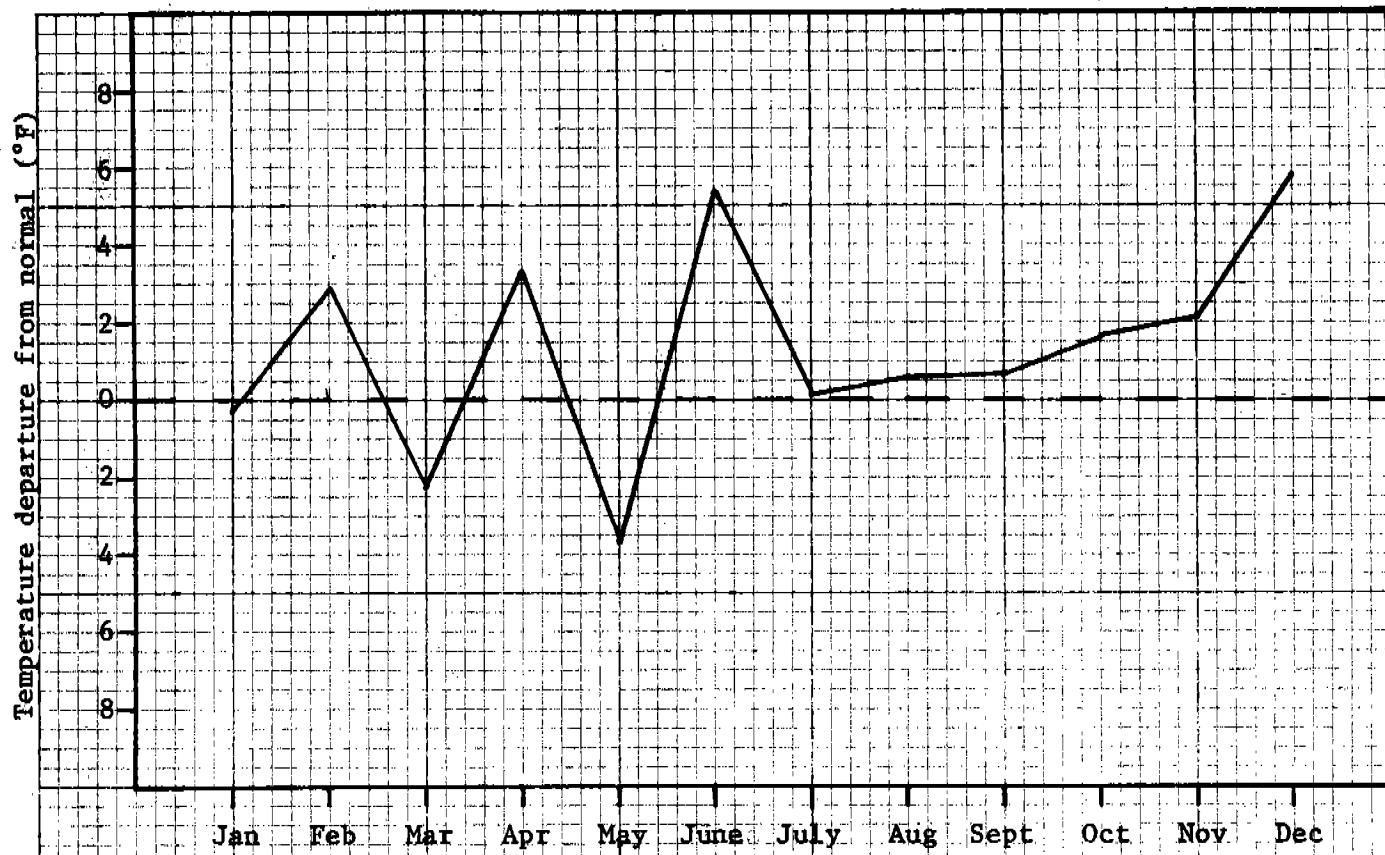

Figure 1. Monthly average temperature departure from normal, 1977.

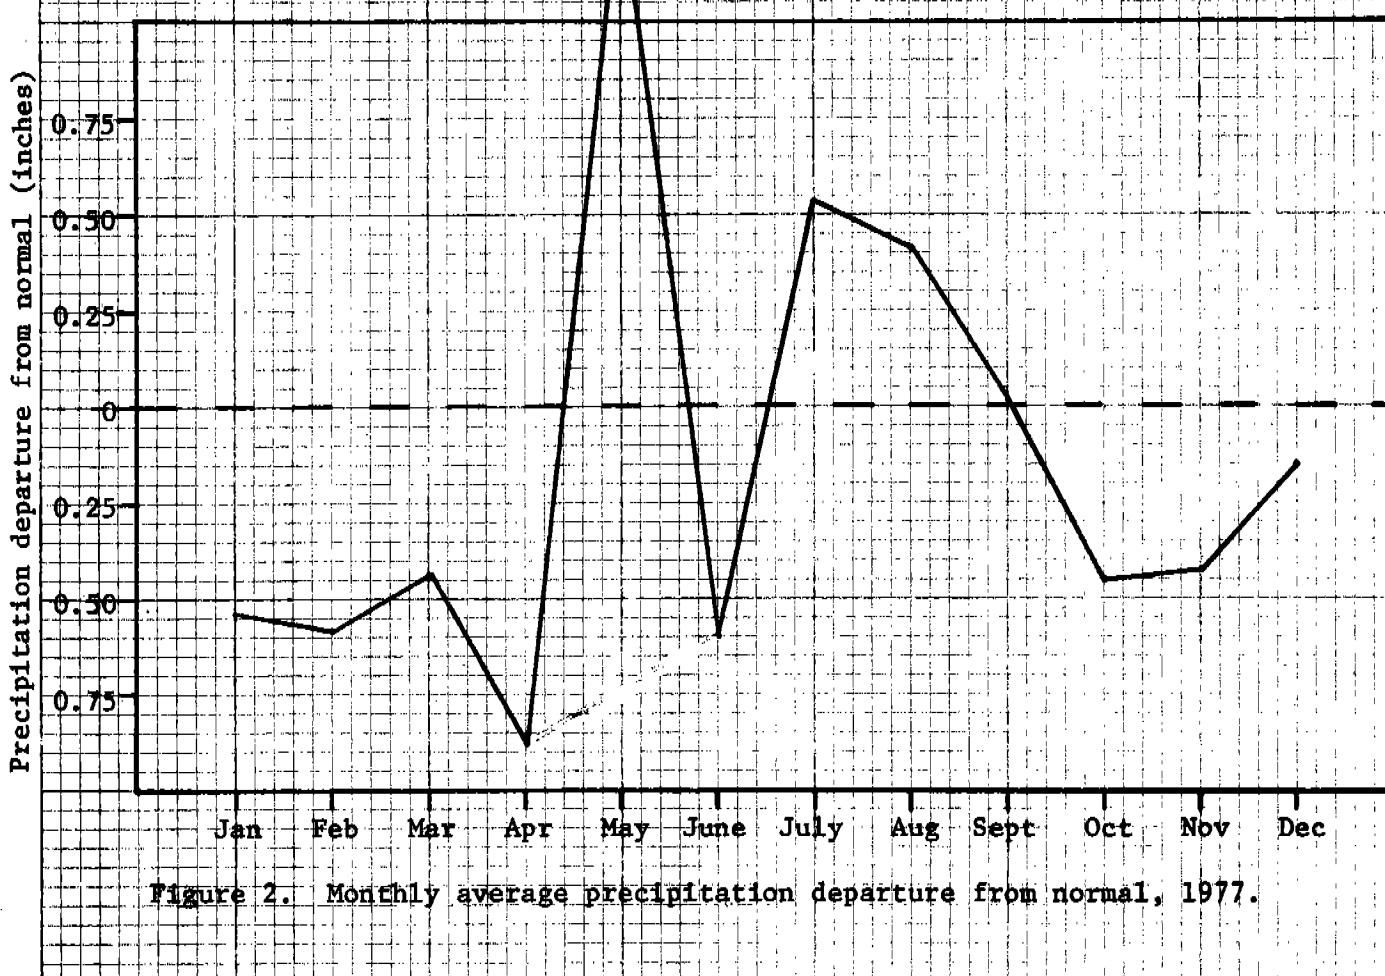

Figure 2. Monthly average precipitation departure from normal, 1977.

# RING-NECKED PHEASANT

## SUMMARY

The statewide breeding population indexes were below the 1976 level and below average except in the northeastern region. However, indexes probably represent poor counting conditions with little snow cover rather than reduced populations. Winter carry-over from 1976 appeared good due to the generally warm open winter.

Weather conditions during the nesting season were variable but generally poor. Production was slightly below 1976 and well below average statewide except in the northeastern region where production was average. The combination of higher carryover and lower production than 1976 resulted in fall populations very similar to the 1976 level and still below average.

Harvest statistics compiled from the questionnaire indicated a hunt very similar to 1976. Harvest was comparable to 1976. Hunter numbers decreased but, birds per hunter day and birds per hunter both increased slightly. Field bag check data showed that hunters spent less time afield per hunter day. The 0.66 birds per hunter index from field bag checks was 15 percent lower than the comparable index from hunter questionnaires.

### Winter Sex-ratio-Counts

Results of the survey for the winter of 1976-77 and long-term trends are shown in tables 1 and 2 of this section. Statewide comparisons to the winter of 1975-76 and the average are as follows:

	<u>Winter of 1976-77</u>	<u>Percent change from 1975-76</u>	<u>Average</u>
Total pheasants counted (roadside)	7,709	-16	-44
Hens per cock	3.3	+ 3	-27
Pheasants observed per 100 hours	1,013	-12	-31
Total hours effort (roadside)	761	- 5	- 7

The winter sex-ratio counts indicated a lower breeding population than in 1976 but counting conditions were poor. Many counts were conducted with no or poor snow cover. Mild winter weather conditions with little snow resulted in high carry-over from 1976. The hen-cock ratio was similar to 1976 and narrower than average. Assuming a preseason sex ratio of 1.2 females per male (summer inventory 1977), hunters harvested about 64 percent of the 1976 fall rooster population, a below average harvest rate compared to 1976.

### Roadside Counts

A summary of summer roadside pheasant counts for 1977 is shown on Table 3. Long-term trends of pheasants per mile, young per mile, young per hen, percent of hens with young and mean brood size are found in tables 4-8. Summer 1977 survey results compare to 1976 and average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Total pheasants observed	2,049	-10	-43
Total miles driven	2,902	0	+ 2
Pheasants per mile	0.71	- 9	-44
Average brood size	4.94	- 8	- 9
Young per hen	3.11	-13	-23
Percent of hens with young	65	- 8	-12

April temperatures were somewhat above normal with low precipitation. May temperatures were much below normal and precipitation was very high. June was warm and dry. Counting conditions were near average over most of the state.

Production decreased from 1976 and remained well below average. Production was below 1976 levels in all regions and was almost 25 percent below the long-term state average. The density index (pheasants per mile) decreased from .78 in 1976 to .71 in 1977 and was well below the average of 1.27 pheasants per mile.

An increased carry-over from 1976 coupled with decreased production during 1977 resulted in pheasant populations similar to the 1976 population level.

## Harvest

### Hunter Questionnaire

Results of the hunter questionnaire for 1977 are shown in Table 9. Long-term trends of pheasants bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 10-12 and total statewide harvest statistics in Table 13. Following is a comparison of 1977 harvest statistics to 1976 and the average:

	1977	Percent change from	
		1976	Average
Pheasant hunters	67,195	- 9	-20
Pheasants harvested	148,168	- 2	-38
Hunter-days afield	191,142	-11	-14
Pheasants per hunter-day	0.78	+10	-30
Pheasants per hunter	2.84	+39	-01

Total hunters decreased from 1976 to the lowest level recorded since the initiation of a harvest survey in 1948. Hunter-days afield also declined. The total harvest decreased. Hunter success (pheasants per hunter-day and pheasants per hunter) increased over 1976 but remained below average.

Long-term trends (1964-77) of total hunters, hunter-days, harvest and hunter success are shown in Figure 1.

### Field Bag Checks

A summary of pheasant field bag check data for 1977 is shown in table 14. The hunter success trend determined via bag checks since 1972 is found in table 15. A comparison of 1977 data on a statewide basis to 1976 and the average follows:

	1977	Percent change from	
		1976	Average
Total hunters checked	6,029	+24	+36
Total hours hunted	19,448	+20	+28
Pheasants per hunter (complete hunts)	0.66	-22	-27
Pheasants bagged per 100 hours	16	0	-16
Average hours per hunter-day (complete hunts)	4.1	-18	-13
Hours hunted per pheasant bagged	6.2	+ 7	+13

The increase in total hunters checked reflects increased efforts to collect data rather than increased hunter pressure. Some new checking stations were established to collect pheasant wings for age structure analysis and to collect field bag check data. The 0.66 birds per hunter index was 15 percent below the comparable index derived from the harvest questionnaire (0.78 birds per hunter day).

Overall, the field bag check showed decreased hunter effort per day and decreased hunter success compared to 1976. The average hunter spent 4.1 hours afield, compared to 5.0 for 1976.

Pheasants bagged per hunter and per hunter-day.

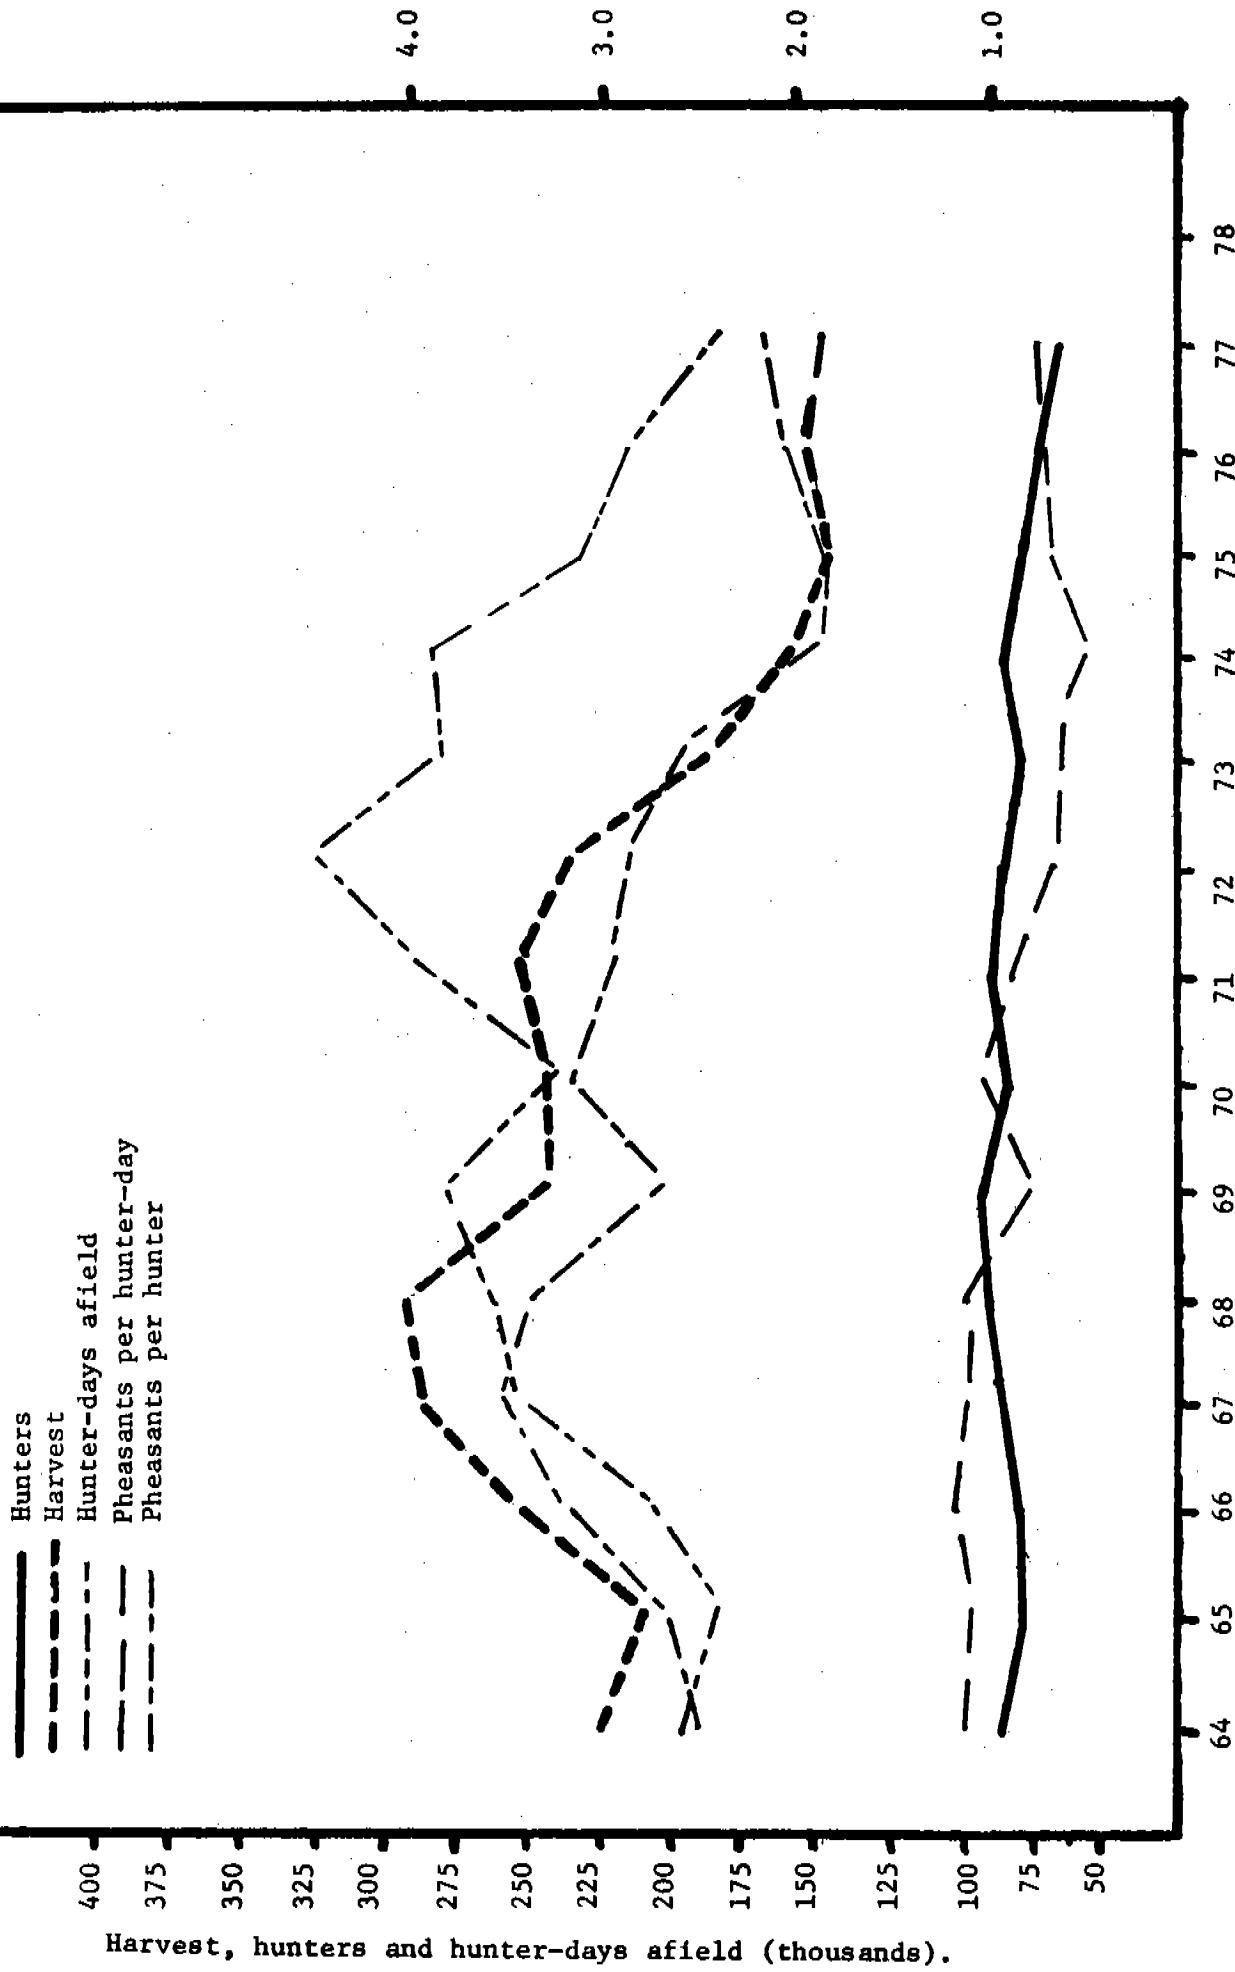

Figure 1. Statewide trend of pheasant harvest statistics.

# MIGRATORY UPLAND GAME BIRDS

## SUMMARY

### Mourning Doves

The breeding density index decreased slightly in 1977 but was near average. May weather was cold and wet statewide and may have curtailed early nesting.

Harvest statistics derived from the questionnaire showed decreased hunter pressure and harvest but increased hunter success compared to 1976. Although harvest decreased from 1976, the total harvest was among the highest ever recorded and was over 50 percent above the 1951-1976 average.

Field bag checks indicated slightly increased hunting pressure and reduced hunter success contrary to the questionnaire survey. Neither survey indicated a substantial change from 1976. The 1977 hunt was similar to the 1976 hunt.

Fewer wings were collected for aging during 1977 than in 1976 and 1975. The adult:juvenile ratio was among the highest ever recorded and indicated a delayed hatch and subsequent delayed migration of young doves.

### Band-tailed Pigeons

During 1977, 319 band-tailed pigeons were banded raising the long-term total (since 1969) to 2,547. An additional 64 previously banded pigeons were recaptured.

Hunter participation during the 1977 season remained at an extremely low level with only 47 hunters afield. Total hunter-days decreased from 1976 but remained above average. Total harvest was the highest ever in Utah with 302 pigeons harvested.

## MOURNING DOVE

### Call-Count Survey

Results of the 1977 call-count survey are found in Table 1 of this section. The long-term trend of the State's Breeding Density Index (Average doves heard per route) is shown in Table 2. Indexes shown in each of these tables are unweighted and consequently differ from those published in the annual Mourning Dove Status Report compiled by the Fish and Wildlife Service; however, indicated trends are similar (Figure 1). Following is a comparison of the results of the 1977 survey to 1976 and the average for the period 1964-76:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Total doves heard per route	14.3	- 4	- 5
Total calls heard per route	51.1	-26	-20
Total doves seen per route	10.9	-27	-32

The 1977 breeding population was very similar to 1976. May weather was cold and wet following the dry spring and winter. Early production may have been adversely affected by the cold wet May weather.

### Harvest

#### Hunter Questionnaire

Information obtained from the hunter questionnaire for 1977 is summarized in Table 3. Long-term trends of mourning doves bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 4-6 and total statewide harvest statistics in Table 7. Harvest statistics for 1977 compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Mourning dove hunters	26,905	-14	+40
Mourning dove harvest	267,487	-10	+49
Hunter-days afield	83,218	-23	+43
Mourning doves per hunter-day	3.21	+17	-13
Mourning doves per hunter	9.94	+ 4	+12

Hunting pressure and harvest decreased from 1976, but hunter success increased. The harvest was among the highest on record.

Long-term harvest trends are depicted in Figure 2.

### Field Bag Checks

A summary of field bag check data for 1977 is shown in Table 8. Hunter success trends determined via this method are shown in Table 9. Results of the 1977 survey compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from</u>	
		<u>1976</u>	<u>Average</u>
Total hunters checked	1,623	+ 8	+12
Total hours hunted	4,649	+10	+12
Doves per hunter (complete hunts)	3.14	-18	-14
Doves bagged per 100 hours	90	- 7	- 9
Average hours per hunter-day (complete hunts)	3.4	0	- 6
Hours hunted per dove bagged	0.9	0	-18

Field bag checks indicated slightly increased hunting pressure and reduced hunter success contrary to the questionnaire results. Neither survey indicated substantial change and the 1977 hunt was comparable to the 1976 hunt. Dove hunters spent the same amount of time afield per hunter-day as in 1976 and the same time was spent per dove bagged.

### Age Composition of the Harvest

A summary of the age composition of harvested mourning doves from 1967 through 1977 is contained in Table 10. Hatching dates for immature doves harvested in the Northern Region are shown in Table 11.

Following is a comparison of data collected in 1977 to 1976 and long-term averages:

	<u>1977</u>	<u>Percent change from</u>	
		<u>1976</u>	<u>Average</u>
Sample size	2,184	-24	-25
Immatures/100 adults	200	+69	+67
Percent of immatures hatched on:			
August 3 or later	36.4	-14	- 4
July 25 or later	81.5	- 2	+ 4
Before July 25	18.5	+11	-13

Fewer wings were collected for aging during the 1977 season compared to 1976 and 1975. The 200 immatures per 100 adults ratio was among the highest recorded and indicated a delayed hatch and subsequent delayed migration of newly hatched young. The proportion of immatures in each age class was similar to 1976 and near average.

### Banding

A banding moratorium was declared for the Western Management Unit beginning in 1976 to facilitate a complete analysis of past accumulated banding data.

A summary of banding accomplished by county and region through 1975 is contained in Table 12, a summary of Statewide recovery rates through 1973 in Table 13 and a summary of recovery and return locations through 1971 in Table 14. A summary of doves recovered in Utah that were banded in other states through August, 1970 is found in Table 15.

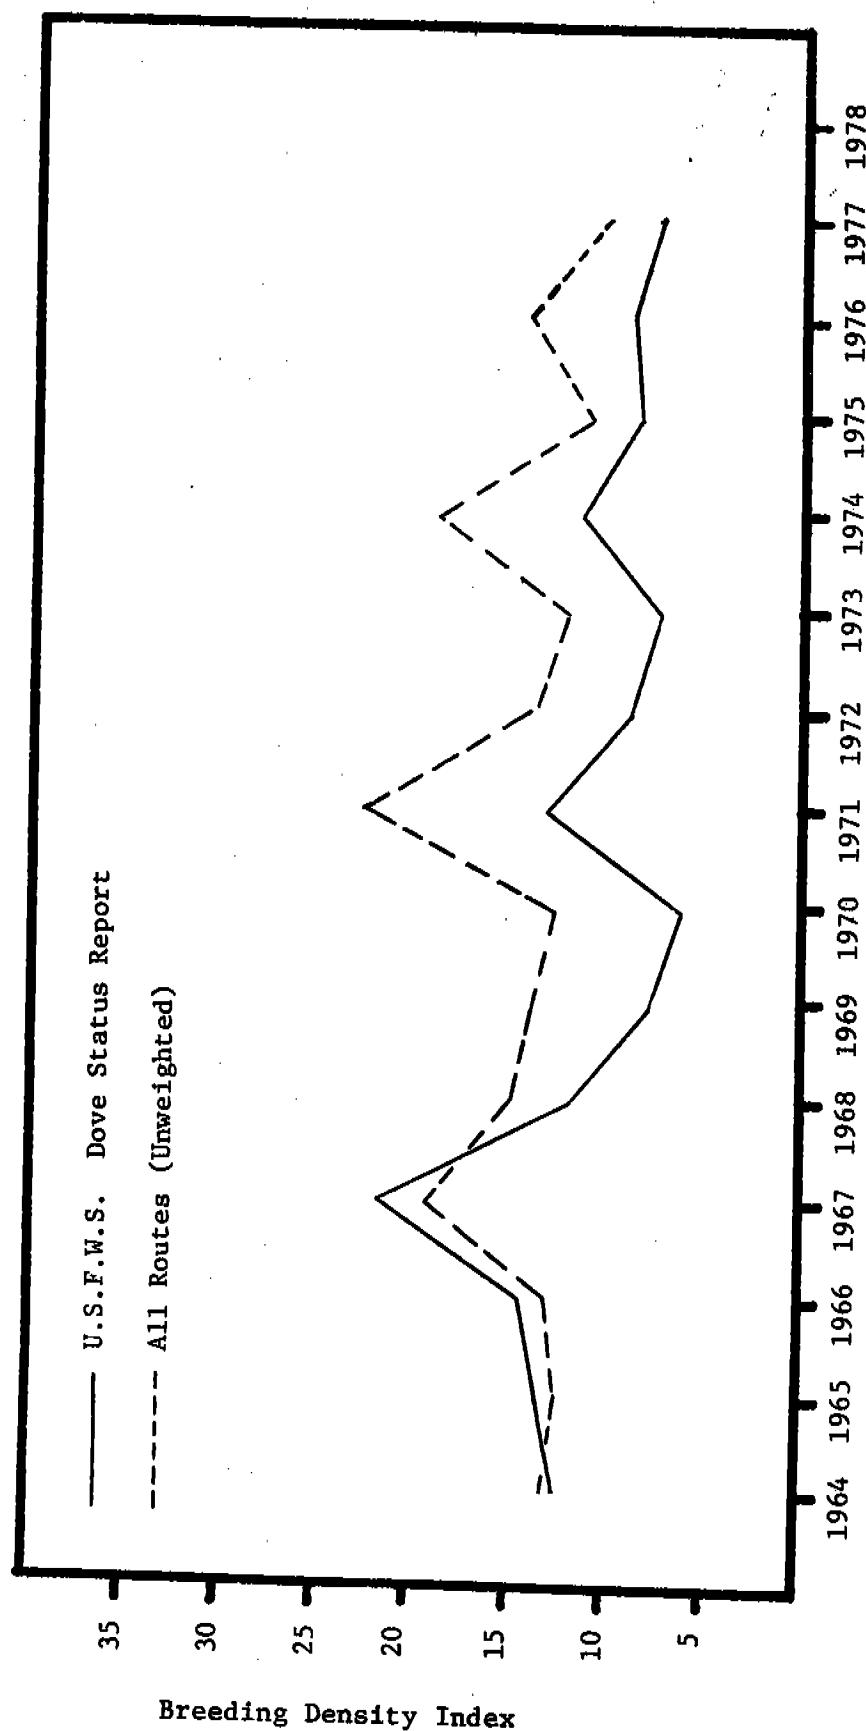

Figure 1. Mourning dove breeding density index trend, 1964-77

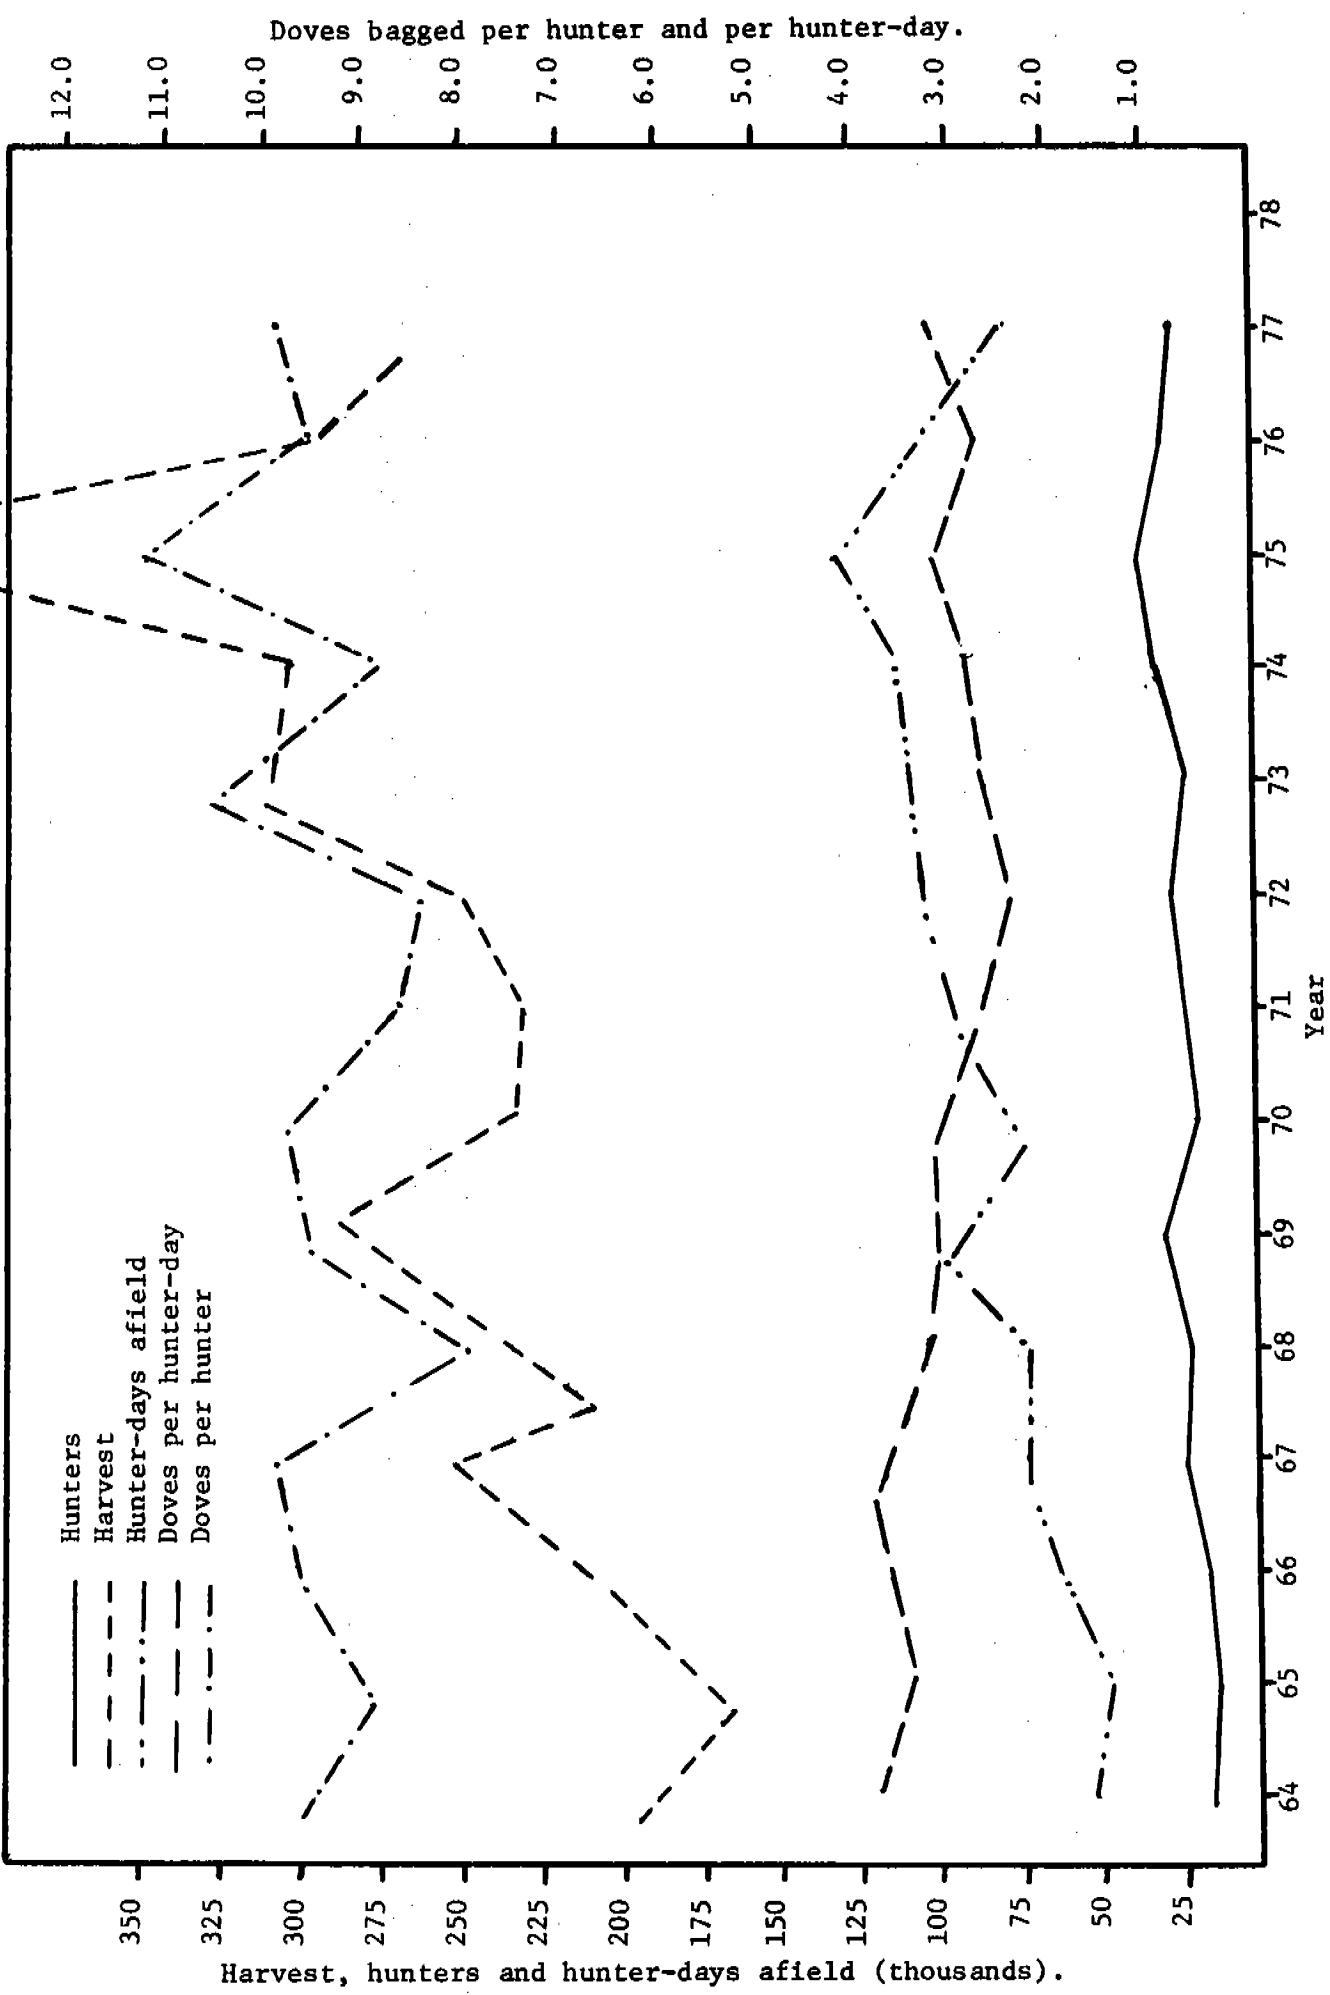

Figure 2. Statewide trends of mourning dove harvest statistics.

## BAND-TAILED PIGEON

### Banding

Results of banding efforts in 1977 are summarized in Table 16 and State totals since 1969 in Table 17.

During 1977, 319 pigeons were banded. An additional 64 previously banded pigeons were recaptured. Since 1969, 2,547 total pigeons have been banded in Utah and 910 recaptured. Results of banding efforts through 1972 indicated a direct recovery rate of 1.4 percent. If expanded using an assumed 30 percent band reporting rate, an estimated harvest rate of less than 5 percent of the State's pigeon population is indicated. Addition of an estimated 16 percent crippling loss would result in a total kill rate of from 5-10 percent; well within the harvestable surplus.

### Harvest

Results of the 1977 harvest questionnaire are shown in Table 18 and harvest trends since 1970 in Table 19. A comparison of the 1977 season to 1976 and the average follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Band-tailed pigeon hunters	47	-13	- 4
Band-tailed pigeon harvest	302	+154	+163
Hunter-days afield	151	- 7	+47
Pigeons per hunter-day	2.0	+174	+79
Pigeons per hunter	6.4	+193	+225

Total hunters decreased somewhat from 1976 and hunter-days afield decreased from 1976. Total harvest increased dramatically over 1976 and was the highest ever recorded, about 50 percent above the previous high harvest (211 in 1972). Most of the 1977 harvest occurred in San Juan County.

K  
A  
R  
S

## **SUMMARY**

The breeding population of chukars was slightly higher in 1976 than in 1975. Over-winter survival was good because of favorable snow conditions. Late winter and early spring precipitation, critical to successful chukar production, was far below average; indicating poor reproductive potential.

Results of the brood survey confirmed the poor reproduction expected due to the lack of spring moisture and resulting poor forage conditions during breeding and nesting. The indicated chukar density was extremely low and the few broods located were generally small.

Harvest statistics reflected the low chukar density with harvest being particularly poor in eastern Utah. Total hunters afield was the lowest since 1959 and harvest was the lowest since 1962.

### Brood Counts

Results of the annual random brood survey for 1977 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and chukars observed per 100 hours are found in Tables 2-4. Survey results for 1977 compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from</u>	
		<u>1976</u>	<u>Average</u>
Total chukars observed	308	-76	-78
Young per 100 adults	170	-13	-59
Mean brood size	5.77	-19	-35
Chukars observed per 100 hours	96	-74	-75
Total hours effort	322	- 8	-12

Harvest data for 1976 indicated increased breeding populations for 1977 in all regions except the Southeastern. Late winter and early spring precipitation (Dec.-April) was extremely meager over the entire state. May precipitation, in contrast, was in near record amounts over most of the state.

Forage conditions were extremely poor until the May rains. The wet cold May weather interferred with nesting and, although forage conditions improved following the rains, the improvement was apparently too late to materially effect chukar production.

Effort on chukar brood counts decreased from 1975 and remained below average. Efforts were probably curtailed somewhat because the extremely low numbers of chukars observed discouraged many observers. The 97 birds observed per 100 hours effort was the lowest recorded state total since prior to 1967 and was 33 percent below the previous low during the period (150 in 1973).

Brood count sample sizes were extremely small (4 or less) for all regions except the Central where 14 of the state total of 22 broods were counted. Indicated production was very low. The 170 young per 100 adult chukars and the 5.77 mean brood sizes were the lowest ratios recorded since prior to 1962.

### Harvest

#### Hunter Questionnaire

Results of the hunter questionnaire survey for 1977 are shown in Table 5. Long-term trends of chukars bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. Following is a comparison of 1977 harvest statistics to 1976 and the average.

	<u>1977</u>	<u>Percent change from</u>	
		<u>1976</u>	<u>Average</u>
Chukar hunters	12,691	-10	-19
Chukars harvested	34,155	-22	-21
Hunter-days afield	38,873	-18	-15
Chukars per hunter-day	0.88	- 5	- 3
Chukars per hunter	2.69	-13	+ 8

Chukars harvested, chukar hunters, hunter days afield and chukars per hunter-day all decreased from 1976 and all were below average. The 12,691 hunters afield was the lowest total since 1959 and the harvest of 34,155 was the lowest since 1962. Daily and seasonal success (chukars per hunter day and chukars per hunter) were both below 1976 but chukars per hunter was slightly above the average. Harvest was especially low in the eastern part of the state where harvest averaged only about one-fourth of the chukar per day compared to near one chukar per day in the western segment of the state.

#### Field Bag Check

A summary of field-bag check data for 1977 is shown in Table 10. The hunter success trend determined via bag checks since 1972 is shown in Table 11. Data for the 1977 season compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Total hunters checked	434	+ 7	-34
Total hours hunted	1,561	+ 4	-49
Chukars per hunter (complete hunts)	0.44	-60	-62
Chukars bagged per 100 hours	10	-58	-58
Average hours per hunter-day (complete hunts)	3.9	- 9	-19
Hour hunted per chukar bagged	10	+156	+122

Field bag checks reflected the low success shown by the questionnaire. Chukars per hunter dropped by 60 percent from 1976 and was over 60 percent below the average. Total hunters checked and total hours hunted increased from 1976 reflecting increased bag check effort principally in Cache County.

The daily hunter success rate shown by field bag checks was only about half the rate shown by the questionnaire. This probably reflects the poor weather during the opening weekend of the hunt. Hunter success apparently increased later in the season but remained low.

The average hours hunted per day decreased somewhat and the amount of time spent to bag each chukar increased dramatically.

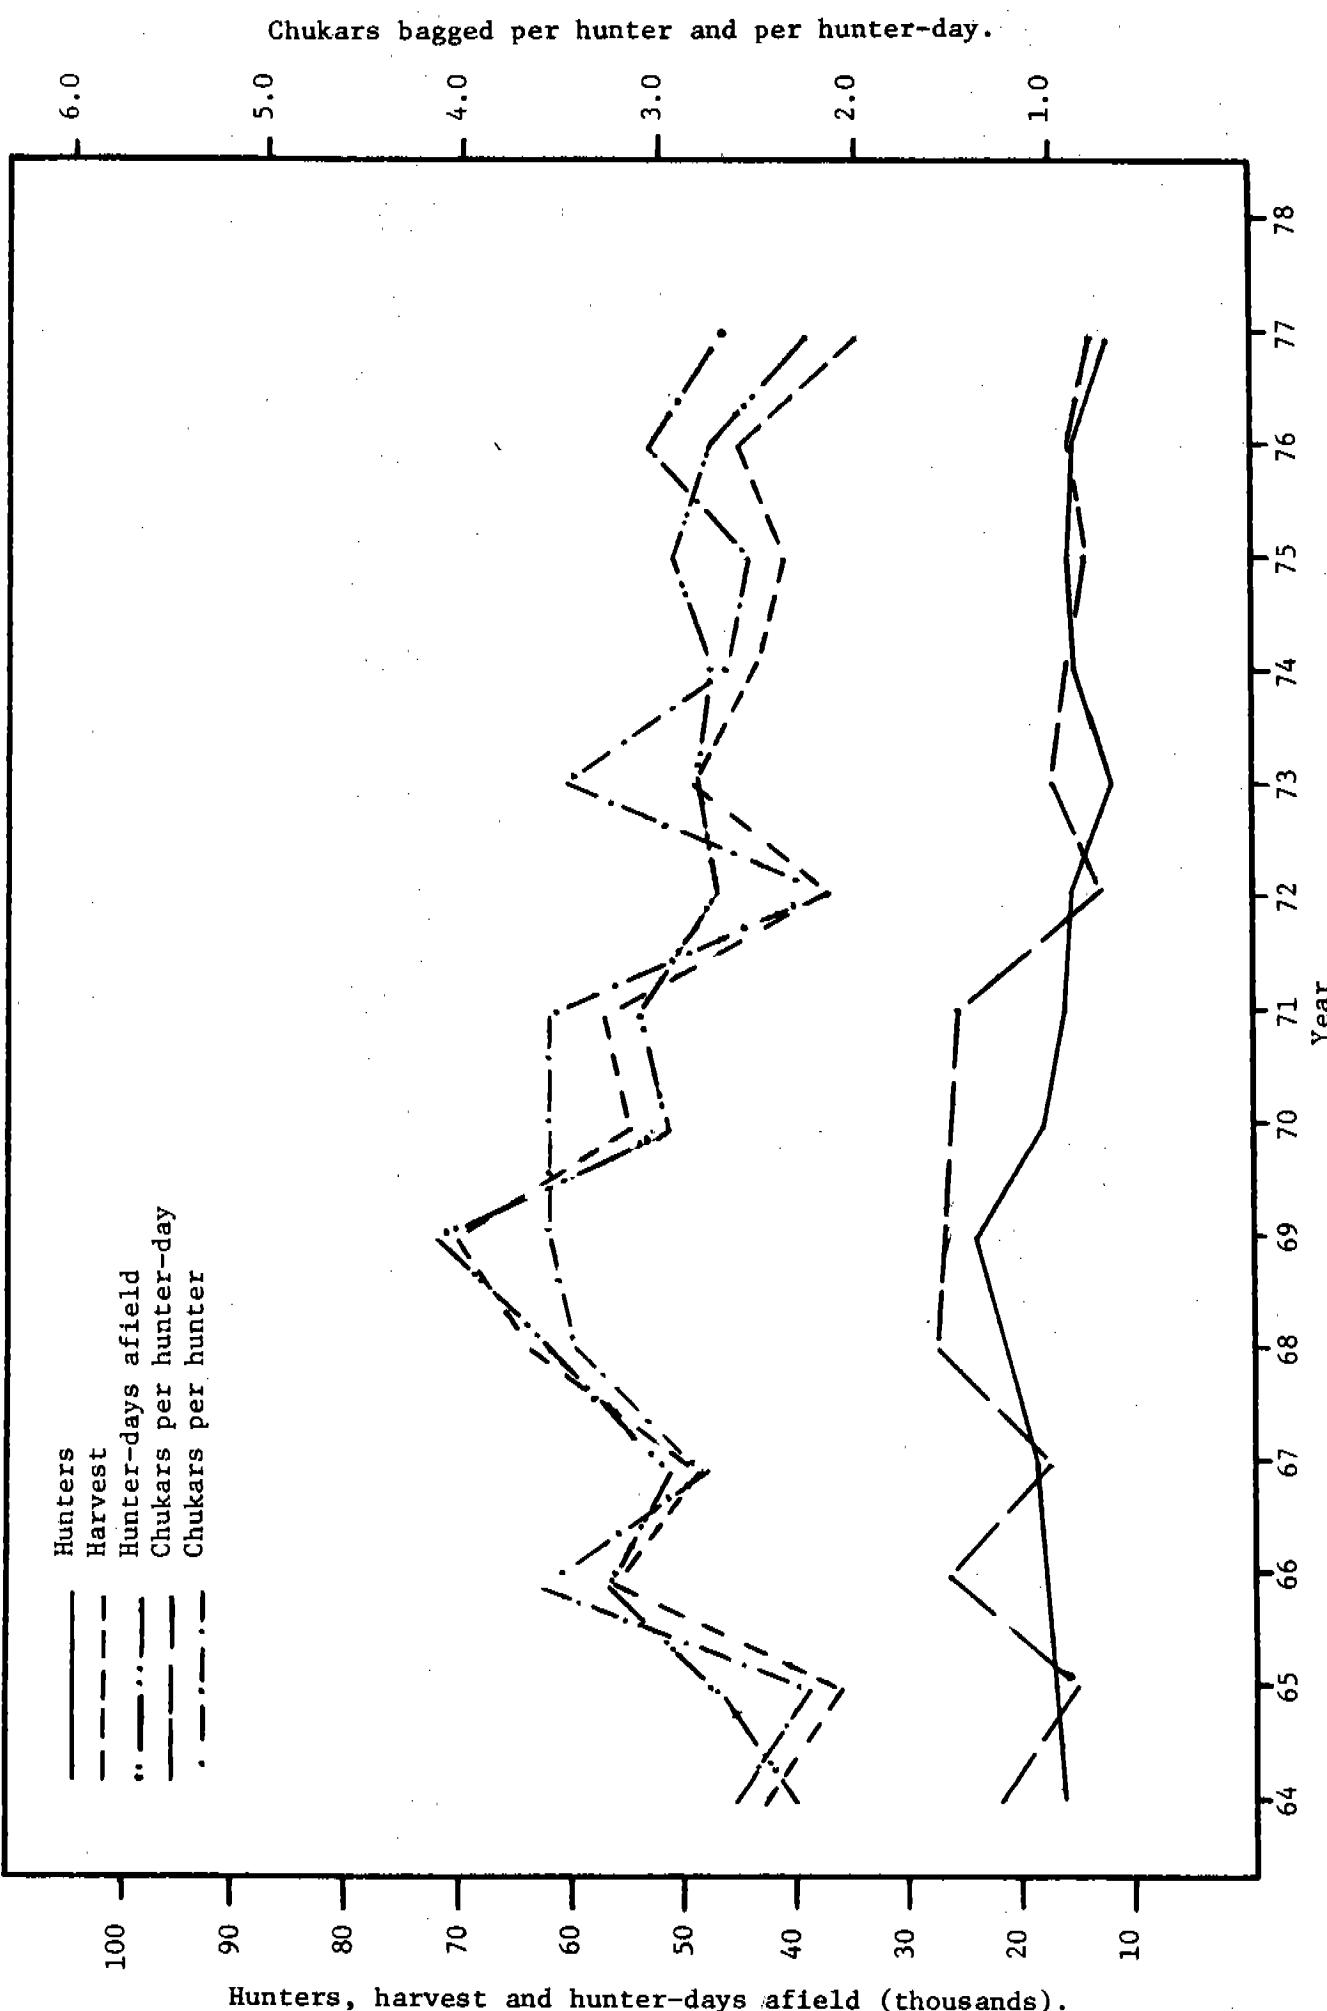

Figure 1. Statewide trends of chukar partridge harvest statistics.

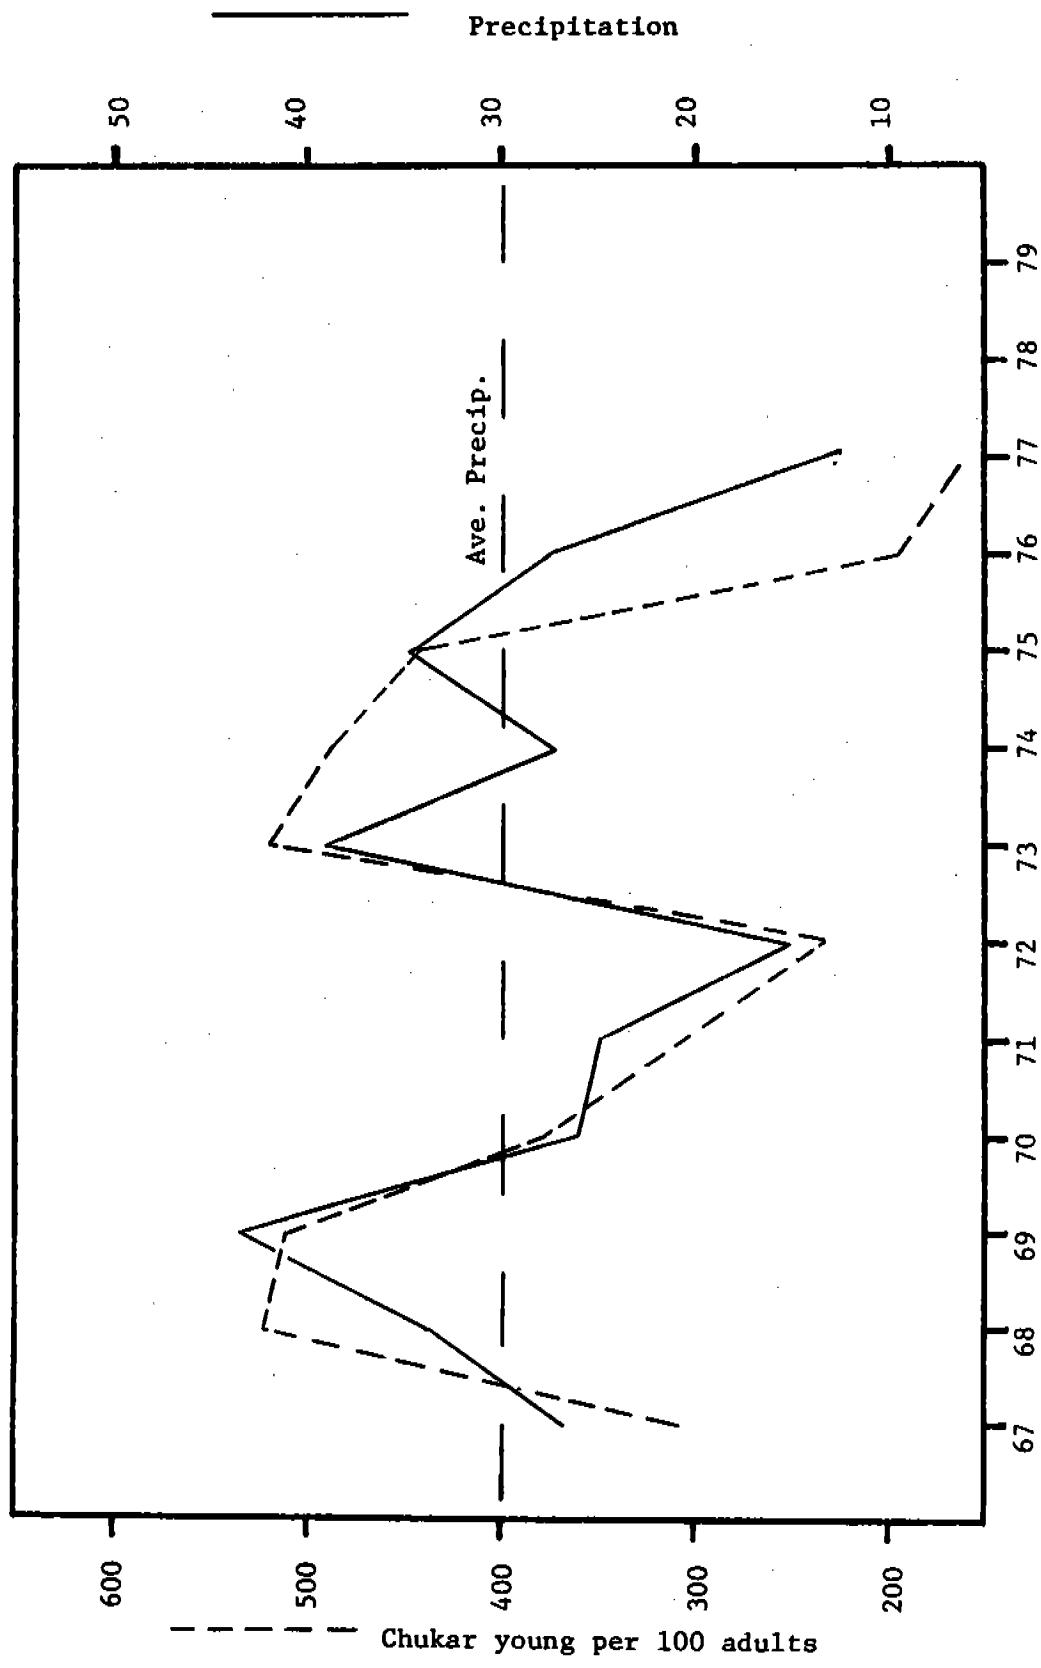

Figure 2. Relationship between late winter and early spring (Jan.-April) precipitation and chukar production.

# SAGE GROUSE

## SUMMARY

Harvest data for 1976 and spring strutting ground counts for 1977 indicated an increased breeding population for 1977.

Brood surveys showed significantly decreased production throughout the state during 1977. Brood size and the percentage of hens with broods both decreased. Statewide production was very poor; well below both 1976 and average.

The poor production of 1977 was apparent in harvest statistics collected from questionnaires and from field bag checks. Total statewide harvest decreased by almost 25 percent. Total hunters and hunter-days afield both decreased. Sage grouse bagged per hunter and per 100 hours effort both decreased markedly.

Wing samples collected at checking stations confirmed the poor 1977 production. The young per 100 adult ratio dropped by 60 percent and the young per 100 adult hens ratio dropped almost as dramatically. Production was substantially below 1976 and average.

### Strutting Ground Counts

The status of the sage grouse breeding population for 1977 as indicated by strutting ground counts is shown in Table 1 of this section. Results of this survey for 1977 compared to 1976 and the 1967-77 average as follows:

		<u>Percent change from</u>	
	<u>1977</u>	<u>1976</u>	<u>Average</u>
Number of grounds counted	136	+ 4	+40
Total grouse counted	2,855	+16	+41
Average male grouse per ground	21.0	+12	-11
Percent change from previous year (comparable grounds)	+6.2	--	--

The spring 1977 strutting ground counts indicated increased breeding populations in the Northern, Southern and Southeastern regions. Counts were down slightly (6.2 percent) in the Central region and down 13 percent in the Northeastern region. The statewide index for comparable grounds was up 6.2 percent. Harvest data for 1976 indicated increased populations going into the 1976-77 winter throughout the state compared to 1975.

### Brood Counts

Results of this survey for 1977 are found in Table 2. Long-term trends of young-adult ratios, mean brood size and sage grouse observed per 100 hours are shown in Tables 3-5. Indexes for 1977 compared to 1976 and the average as follows:

		<u>Percent change from</u>	
	<u>1977</u>	<u>1976</u>	<u>Average</u>
Total sage grouse counted	4,123	- 1	+36
Young per 100 adults	87	-49	-42
Mean brood size	3.99	-18	-12
Sage grouse observed per 100 hours	445	+ 4	+29
Total hours effort	926	- 5	+ 6

The effort devoted to sage grouse brood counts was down somewhat compared to 1976 but was above average. The total number of grouse counted was comparable to 1976 and well above average.

Significantly decreased production was apparent throughout the state during 1977. Mean brood size decreased in every region and by almost one chick per brood statewide.

The young per 100 adult ratio decreased statewide except in the Southeastern region; statewide the decrease was almost 50 percent. Statewide production was poor, below both 1976 and average.

Production during 1976 was good and the breeding population for 1977 was generally up but production during 1977 was very poor. As a result, the fall 1977 population level was below 1976 levels. The spring 1977 population contained a fairly high percentage of yearling hens who are characteristically less successful nesters than adults. The combination of yearling hens and poor nesting conditions during May resulted in poor production.

## Harvest

### Hunter Questionnaire

Results of the 1977 hunter questionnaire are shown in Table 6. Long-term trends of sage grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 7-9 and total statewide harvest statistics in Table 10. The 1977 hunting season compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Sage grouse hunters	14,078	- 8	+41
Sage grouse harvested	18,615	-24	+36
Hunter-days afield	25,759	- 9	+58
Sage grouse per hunter-day	0.72	-17	-17
Sage grouse per hunter	1.32	-18	- 3

The very poor production of 1977 was very apparent in the harvest. Total statewide harvest decreased by almost 25 percent and the harvest consisted of a much higher percentage of adult birds (see below, Sex and Age Composition of Harvest). Total sage grouse hunters and hunter days-afield both decreased from 1976. Hunters and days-afield remained above long-term averages reflecting the increased interest in sage grouse hunting. Hunter success decreased in every region except the Central where it was comparable to 1976.

Long-term sage grouse harvest trends are shown in Figure 1.

### Field Bag Checks

A summary of field bag check data for 1977 is shown in Table 11. Hunter success trends determined via this method are shown in Table 12. Results of the 1977 survey compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Total hunters checked	2,859	+14	+42
Total hours hunted	11,271	+21	+41
Sage grouse per hunter (complete hunts)	0.65	-27	-18
Sage grouse bagged per 100 hours	15	-32	-21
Average hours per hunter-day (complete hunts)	4.3	+ 8	+10
Hours hunted per grouse bagged	6.8	+55	+23

Field bag checks substantiated the harvest questionnaire data on hunter success. Sage grouse bagged per hunter decreased by over one-quarter of a bird and grouse bagged per 100 hours effort decreased by one-third. The average hunter spent slightly more time afield than in 1976. Hunter interest was apparently high as more hunters were checked at checking stations than during 1976.

### Sex and Age Composition of the Harvest

A summary of the sex and age composition of harvested sage grouse in 1977 is found in Table 13 and the trend from 1974-77 in Table 14.

Following is a comparison of data derived from wing surveys in 1977 to 1976 and the 1973-76 averages:

	<u>1977</u>	<u>Percent change from</u>	
		<u>1976</u>	<u>Average</u>
Sample size	1,207	-20	+ 9
Percent males	44	- 2	0
Percent females	56	+ 2	- 3
Young per 100 adults	78	-60	-47
Young per 100 hens (adult)	133	-56	-41

Analysis of wing samples collected at checking stations confirmed the poor 1977 production indicated by summer brood surveys. The young per 100 adult ratio dropped by 60 percent and the young per 100 hens dropped almost as dramatically ( down 56 percent). Both figures were substantially below average.

Sage grouse bagged per hunter and per hunter-day.

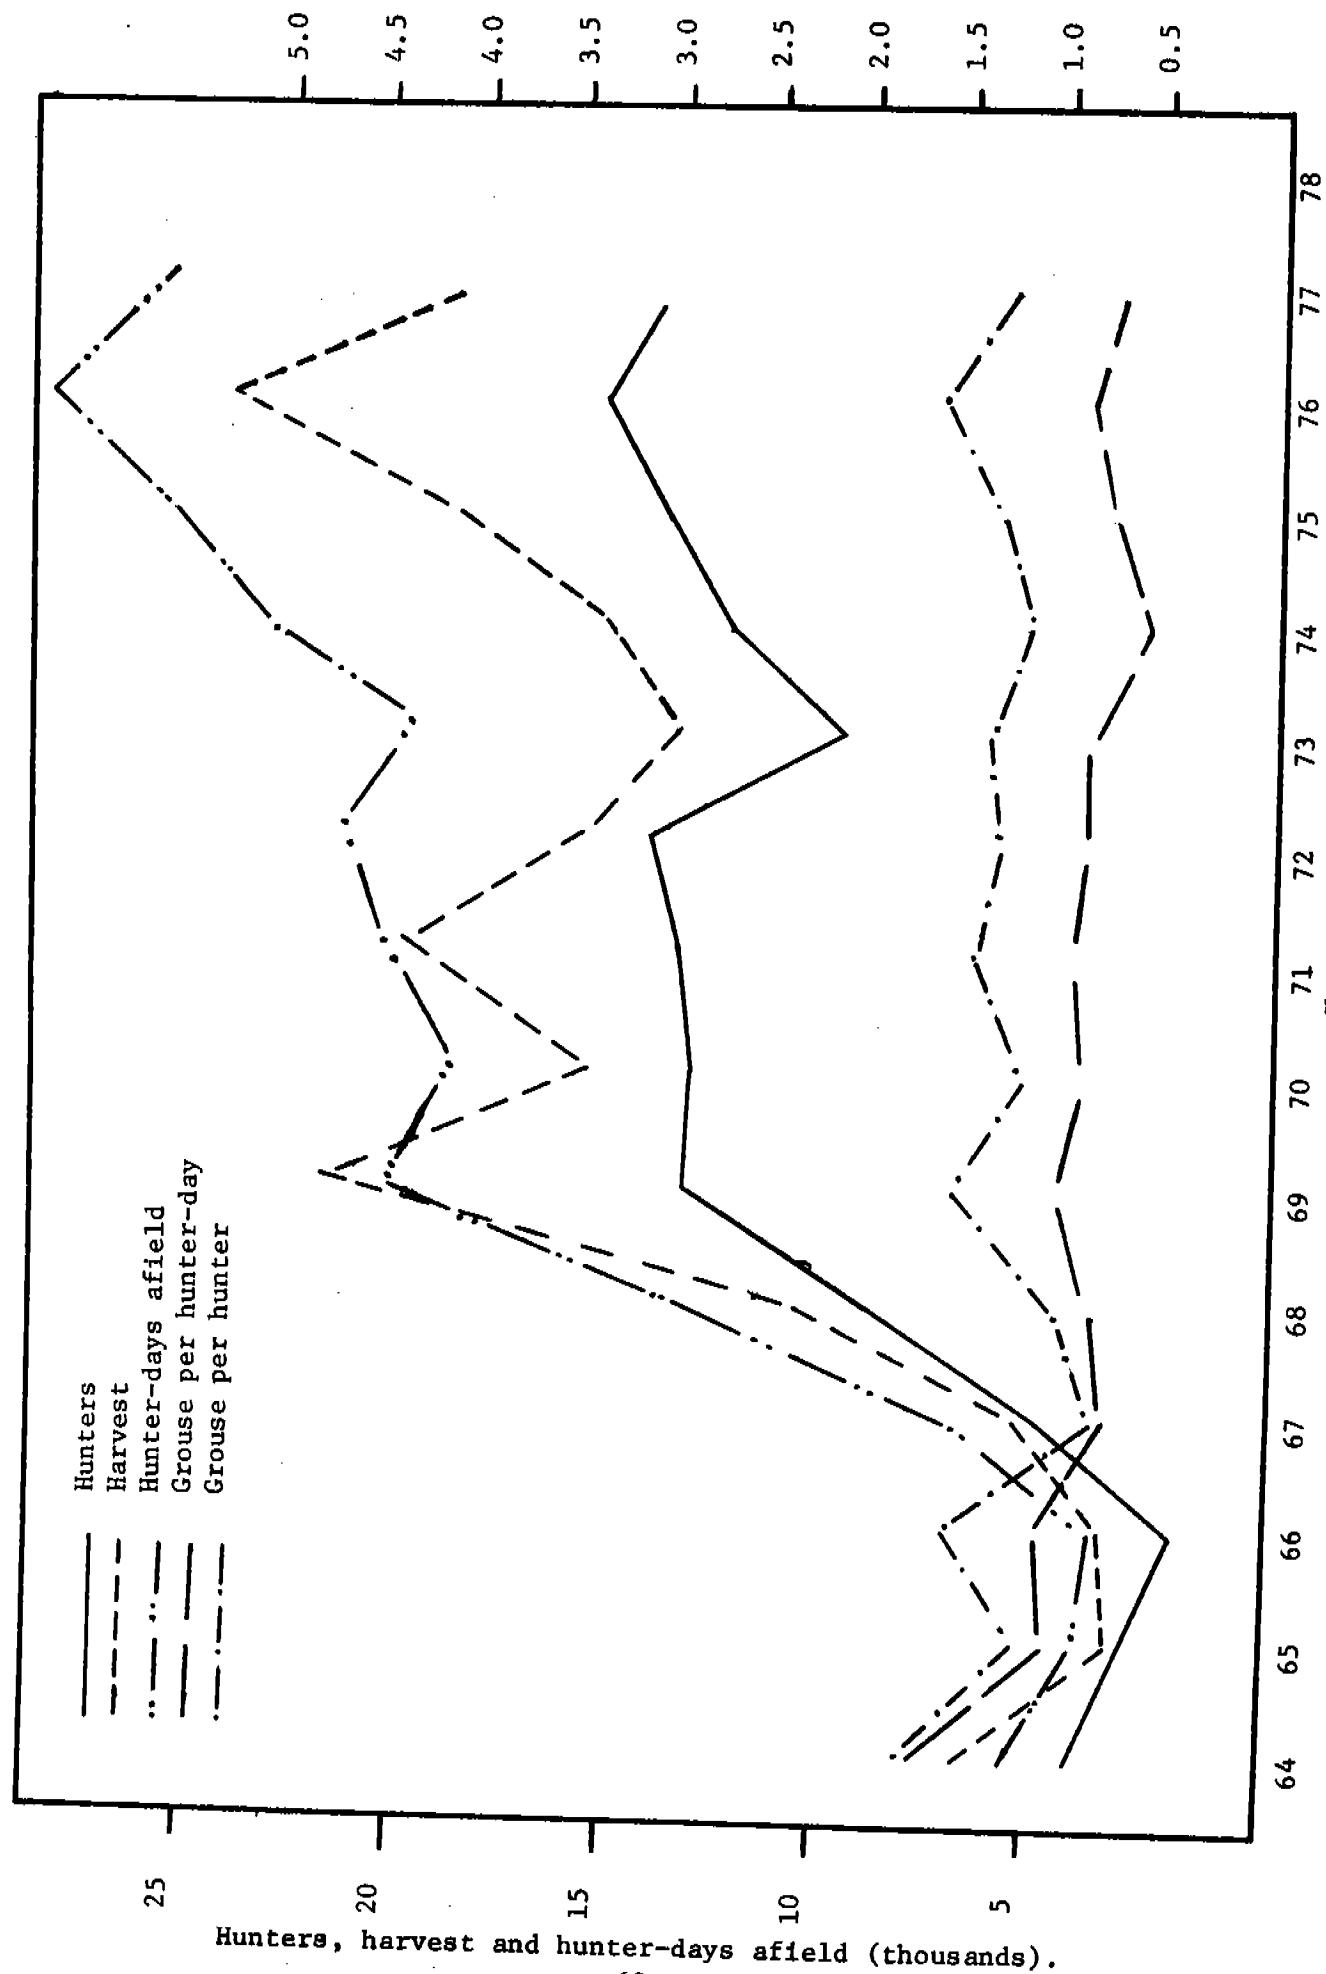

Figure 1. Statewide trend of sage grouse harvest statistics.

# FOREST GROUSE

## SUMMARY

Judging from harvest statistics for 1976, the 1977 breeding populations of both ruffed and blue grouse were up from 1976. Production of ruffed grouse indicated by a small brood sample was up from 1976 to near average. Blue grouse production was very poor during 1976; the poorest recorded since before 1966. The number of grouse of both species observed during brood surveys and the apparent density (grouse per 100 hours) suggested a markedly decreased abundance in 1977 compared to 1976; with figures down 44 percent and 32 percent from long-term averages for ruffed and blue grouse respectively. A total of only 93 forest grouse broods were observed during 1977 compared to 181 during 1976.

Harvest statistics confirmed the low density of forest grouse. Total harvest decreased from 63,436 during 1976 to 42,476 in 1977; a 33 percent decrease in harvest. Total hunters decreased from 21,186 in 1976 to 19,188 in 1977 and days-afield decreased from 56,422 to 48,746; 9 percent and 14 percent decreases respectively.

Field bag check data confirmed the reduced pressure and success shown by the questionnaire. Poor opening day weather combined with low grouse numbers depressed field bag check data even more dramatically than questionnaire results.

### Brood Counts

#### Ruffed Grouse

Results of the annual random brood survey for 1977 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and ruffed grouse observed per 100 hours are found in Tables 2-4. A summary of effort expended on ruffed and blue grouse brood counts combined is shown in Table 9. Survey results for 1977 compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Total ruffed grouse observed	191	-32	-33
Young per 100 adults	298	+22	- 1
Mean brood size	4.26	+ 3	- 7
Ruffed grouse observed per 100 hours	23	- 8	-41
Total hours effort (Forest Grouse)	843	-24	+ 3

Harvest statistics for 1976 indicated an increased breeding population for 1977.

Effort on brood surveys decreased in comparison to 1976 but remained average.

Total ruffed grouse observed decreased from 1976 and was well below average. The density index (grouse observed per 100 hours) was slightly below 1976 and far below average.

Mean brood size, based on a small sample of 30 broods, increased somewhat.

#### Blue Grouse

Results of the annual random brood survey for 1977 are shown in Table 5 of this section. Long-term trends of young-adult ratios, mean brood size and blue grouse observed per 100 hours are found in Tables 6-8. Survey results for 1977 compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Total blue grouse observed	439	-51	-26
Young per 100 adults	181	-36	-34
Mean brood size	4.00	- 7	-14
Blue grouse observed per 100 hours	52	-36	-32
Total hours effort (Forest Grouse)	843	-24	+ 3

Harvest statistics for 1976 indicated an increased breeding population for 1977.

All indications from the 1977 summer surveys on blue grouse were that production was very poor. Despite the indicated increase in breeding population, the total number of grouse observed decreased by over 50 percent. The young per 100 adult ratio and number of grouse observed per 100 hours effort both decreased by over one-third.

Casual observation from the field and the summer inventory both indicated a substantially reduced fall blue grouse population. Wing samples collected at checking stations in northern Utah confirmed the low production with the adult:juvenile ratio being the lowest recorded since 1968 when collection of wing data commenced.

## Harvest

### Hunter Questionnaire

Results of the 1977 forest grouse (ruffed and blue grouse combined) hunter questionnaire are shown in Table 10. Long-term trends of forest grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 11-13 and total statewide harvest statistics in Table 14. Harvest statistics for 1977 compared to 1976 and the average as follows:

		<u>Percent change from</u>	
	<u>1977</u>	<u>1976</u>	<u>Average</u>
Forest grouse hunters	19,188	- 9	+36
Forest grouse harvested	42,476	-33	+36
Hunter-days afield	48,746	-14	+64
Forest grouse per hunter-day	0.87	-22	-17
Forest grouse per hunter	2.21	-26	0
Percent ruffed grouse	37.1	0	- 9
Percent blue grouse	55.2	- 2	+ 6
Percent unidentified	7.7	+15	+ 7

Results from the harvest questionnaire confirmed the low population level indicated by summer surveys. Although the total number of forest grouse hunters afield decreased by only 9 percent, the total statewide harvest decreased by one-third. A reduction in harvest was evident for both species of forest grouse.

### Field Bag Checks

A summary of field bag check data for 1977 is found in Table 15. Hunter success trends determined via this method are shown in Table 16. Results of the 1977 survey compared to 1976 and the average as follows:

		<u>Percent change from</u>	
	<u>1977</u>	<u>1976</u>	<u>Average</u>
Total hunters checked	1,924	-36	+58
Total hours hunted	7,225	-38	+45
Forest grouse per hunter (complete hunts)	0.28	-58	-61
Forest grouse bagged per 100 hours	7	-58	-63
Average hours per hunter-day (complete hunts)	3.9	- 5	- 7
Hours hunted per grouse bagged	13.6	+123	+142

Field bag checks mirrored the results of the harvest questionnaire. Pressure, harvest and success were all down markedly. Poor opening weekend weather in northern Utah combined with low grouse populations caused field bag check data (the majority of bag checks were collected the opening weekend) to show even poorer hunter success than indicated by the questionnaire.

# **QUAIL**

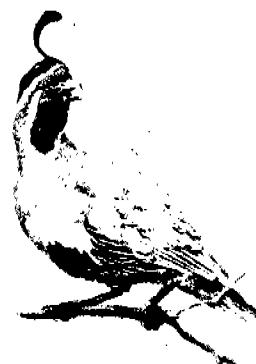

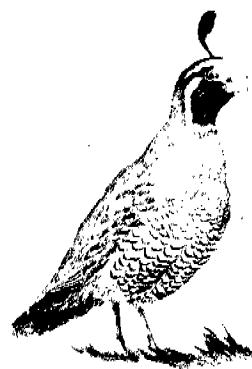

## **SUMMARY**

The 1977 breeding populations of California and Gambel's quail were estimated to be comparable to or slightly higher than 1976.

Production of both Gambel's and California quail decreased from 1976 to much below average. Population densities were lower than 1976 in most areas of the state.

Harvest statistics showed decreased hunter success. Total hunters, total harvest and success were all far below average for both species of quail.

L

### Brood Count

Results of the annual random brood survey for 1977 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and quail observed per 100 hours are shown in Tables 2-4. Survey results for 1977 compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Total quail observed	747	-16	-29
Young per 100 adults	112	-31	-52
Mean brood size	6.25	+12	-12
Quail observed per 100 hours	588	+ 3	-11
Total hours effort	127	-18	-21

Harvest statistics for 1976 indicated slightly increased breeding populations of California quail statewide except in northern Utah and slightly increased numbers of Gambel's quail in Washington County.

Gambel quail call counts on the west slope of Beaver Dam Mountains showed a significant decline from 1976. The 1976 counts may have been artificially depressed by being run one week too late and the 1977 counts were even lower.

Production of both California and Gambel's quail was decreased from 1976 and was much below average. The density index (quail observed per 100 hours) indicated decreased abundance throughout the state.

### Harvest

Results of the annual hunter questionnaire for 1977 are shown in Table 5. Long-term trends of quail bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9.

The 1977 season compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Quail hunters	4,446	-15	-40
Quail harvested	9,496	-34	-56
Hunter-days afield	9,646	-27	-48
Quail per hunter	2.14	-23	-25
Quail per hunter-day	1.15	+ 5	- 1

Total hunters, total harvest and success all decreased during 1977 and were far below average.

Hunter success for Washington County (Gambel's Quail) was down from 1976 and hunting pressure also declined. About 25 percent of the statewide harvest of quail was taken in Washington County during 1977 compared to 40 percent in 1976 and nearly 50 percent in 1975.

Long-term quail harvest statistics are shown in figure 1.

Gambel's Quail Studies

Annual call-count surveys, long-period waterhole counts and vegetative surveys have been conducted on the west slopes of the Beaver Dam Mountains since 1962.

Call counts showed less than one bird calling per route compared to 2.0 in 1976 and 6.0 in 1975.

Waterhole counts totaled 17 birds during 1977 compared to 114 during 1976 and 165 during 1975.

Vegetative studies were discontinued in 1977.

# **HUNGARIAN PARTRIDGE**

## **SUMMARY**

Increased breeding populations for 1977 were suggested by 1976 harvest data. Limited brood data samples suggested increased production but were too small to warrant confidence in indicating trends.

The 1977 hunt was very similar to 1976 and well below average in terms of pressure and harvest.

S

### Brood Counts

Results of the annual random brood counts for 1977 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and Huns observed per 100 hours are shown in Tables 2-4. Results of this survey for 1977 compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from</u>	
		<u>1976</u>	<u>Average</u>
Total Huns observed	211	-15	-32
Young per 100 adults	369	+13	-24
Mean brood size	10.77	+11	+11
Huns observed per 100 hours	131	-45	-48
Total hours effort	161	+55	+25

Harvest data for 1976 indicated an increased breeding population for 1977 in northern Utah and a decreased breeding population in central Utah.

The only broods observed during 1977 were in Box Elder County. The young per 100 adult ratio and mean brood size indicated increased production compared to 1976.

### Harvest

#### Hunter Questionnaire

Results of the annual hunter questionnaire for 1977 are shown in Table 5. Long-term trends of Huns bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. The 1977 season compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from</u>	
		<u>1976</u>	<u>Average</u>
Hungarian partridge hunters	3,557	+ 1	-15
Hungarian partridge harvest	6,360	+ 1	-32
Hunter-days afield	9,058	+ 3	-14
Huns per hunter-day	0.70	- 3	-18
Huns per hunter	1.79	0	-15

The 1977 hunt was very similar to 1976. Total hunters, harvest, days-afield, huns-per-day and per-season all remained essentially unchanged and all were markedly below average.

Long-term trends of hungarian partridge harvest statistics are shown in figure 1.

### Field Bag Checks

Results of this survey for 1977 are shown in Table 10. Hunter success trends determined via this method are shown in Table 11. Indexes obtained for 1977 compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Total hunters checked	30	-25	-81
Total hours hunted	91	-31	-88
Huns per hunter (complete hunts)	0.80	+233	-02
Huns bagged per 100 hours	26	+271	+53
Average hours per hunter-day (complete hunts)	3.0	-14	-36
Hours hunted per Hun bagged	3.8	-73	-38

Almost all the field bag check data was from Box Elder County. The sample was too small to be meaningful but indicated success was up from 1976. Huns bagged per hunter was near average but the average hunter spent less time afield and bagged more birds per hour effort.

# **WILD TURKEY**

## **SUMMARY**

Hunter success and turkey observational data for the 1977 spring season indicated a Statewide turkey population level slightly higher than 1976 and approaching average.

Fall hunting pressure statewide was comparable to 1976 but the total harvest for 1977 was only one-half that of 1976. Both hunter success and total harvest for 1977 were below the long-term average.

### Brood Counts

Annual random brood counts have been conducted each year since the introduction of turkeys into Utah in the early 1950's; however, success in finding broods has usually been poor. Sample sizes have generally been too low to meaningfully indicate relative density or production from year to year. Harvest data for 1976 indicated an increased breeding population for 1977. No turkey brood observations were reported in 1977.

### Harvest

#### Spring Gobbler Season

Results of the 1977 spring season are shown in Table 1 of this section. The trend of these data since the first season in 1967 is shown in Table 2. The 1977 spring season compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Permits sold	108	+33	-39
Hunters afield	99	+33	-40
Turkeys harvested	12	+100	-20
Hunter-days afield	248	+34	-40
Percent hunter success	12	+50	+50
Turkeys bagged per hunter-day	0.05	+67	+25
Percent of hunters who observed turkeys	39	+22	+18

Permit sales and consequently hunters afield and total hunter-days afield increased from 1976 but remained well below average. The total harvest increased from 6 in 1976 to 12 in 1977. The proportion of hunters who reported having observed turkeys increased to an above average level. The East Zion and LaSal units accounted for 70 percent of the hunting pressure and 83 percent of the harvest.

The trend of spring turkey harvest statistics is shown in Figure 1.

#### Fall Season

Results of the 1977 fall season are shown in Table 3 of this section. The trend of these data since 1966 are shown in Tables 4-9. The 1977 season compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Permits sold	60	-12	-66
Hunters afield	53	- 5	-68
Turkeys harvested	7	-53	-86
Hunter-days afield	133	- 2	-66
Percent hunter success	15	-44	-32
Turkeys bagged per hunter-day	0.06	-45	-50
Percent of hunters observing turkeys	18	-44	-50

Turkey permit sales, total hunters and hunter-days afield all decreased from 1976 and remained well below average.

Permit sales, hunters afield and hunter-days afield all decreased slightly from 1976 and remained well below average. Harvest declined 53 percent and was far below average. The percent of hunters observing turkeys declined by 44 percent and was only 50 percent of average.

The trend of fall harvest statistics is shown in Figure 2.

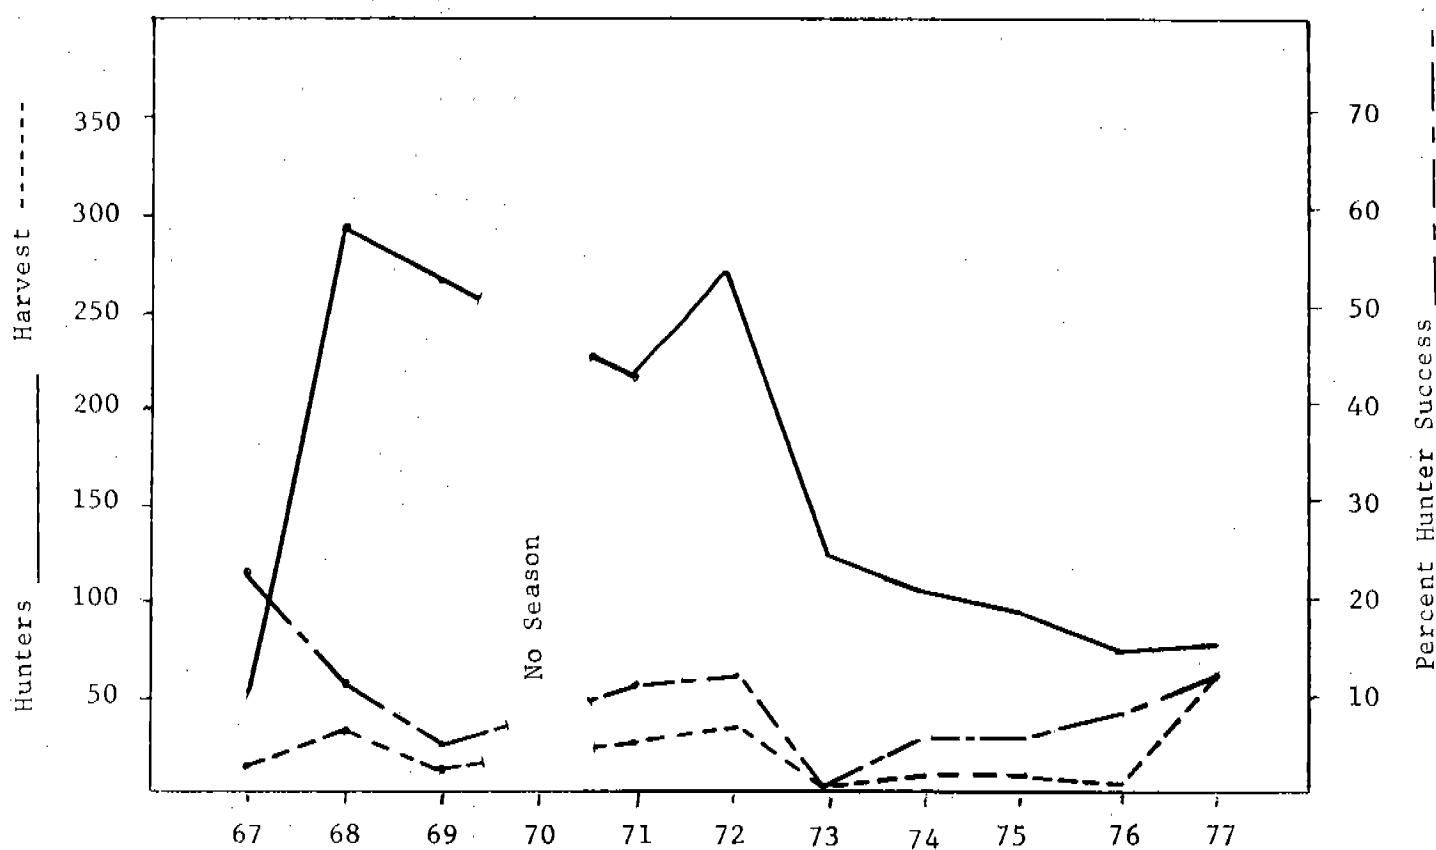

Figure 1. Wild turkey gobbler harvest trends for spring seasons.

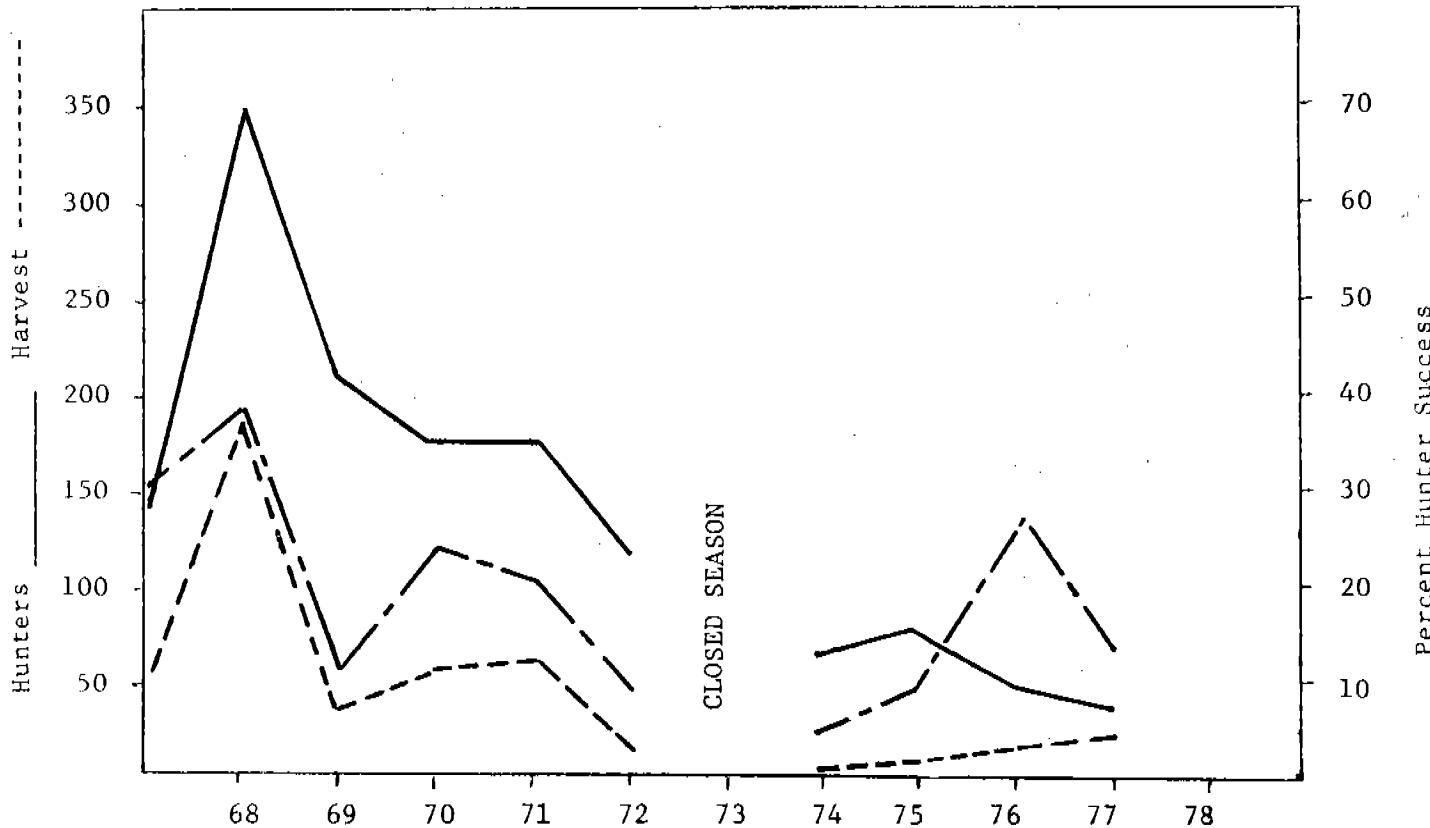

Figure 2. Wild turkey harvest trends for fall seasons.

Table 2. Summary of turkey harvest statistics for spring gobblers seasons, 1967-77.

Turkeys observed	748	2321	466	564	451	173		83	57	182	48	593
No. hunters who observed turkeys	59	171	31	47	40	21		8	8	15	8	60
Percent of hunters who observed turkeys	48	54	17	31	28	21		38	26	32	18	36

\*During 1966, 1968 and later years some hunters hunted more than one area or failed to designate areas hunted. This accounts for the difference between totals given above and combined tables of separate units in Tables 5, 6 and 7.

\*\*During 1968 the Boulder Mountain and East Zion units had two-bird season limits and the LaSal Mountain a one-bird limit; from 1969 through 1972 all areas had a two-bird limit. Hunter success was based on the number of successful hunters rather than total turkeys bagged.

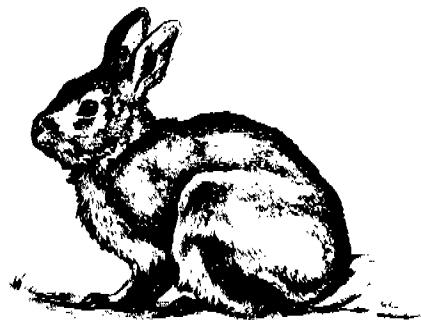

# RABBITS AND HARES

## SUMMARY

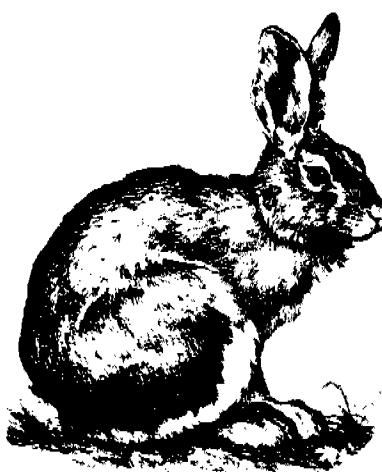

### Cottontail Rabbits

An increased breeding population level for 1977 was indicated by 1976 harvest statistics.

Summer roadside counts indicated an increased population density in northern and central Utah. Harvest statistics indicated a record harvest (269,263) and a record number of hunters afield (35,831).

### Snowshoe Hares

The 1977 snowshoe hare hunting season was the third held since the Legislature provided protected status to this species in 1975.

Harvest statistics reflected increased hunter participation, hunter success and total harvest. However, results shown are biased upward by an unknown quantity because of hunters confusing snowshoes with the white-tailed jack-rabbit.

## COTTONTAIL RABBIT

### Roadside Counts

Results of the annual roadside counts for 1977 are shown in Table 1 of this section. The trend of cottontails observed per mile and young per 100 adults since 1967 is shown in Tables 2 and 3 respectively. Indexes for 1977 compared to 1976 and the average as follows:

		<u>Percent change from</u>	
	<u>1977</u>	<u>1976</u>	<u>Average</u>
Total miles driven	2,907	- 5	+11
Total cottontails counted	914	-21	- 2
Cottontails observed per mile	0.31	-18	- 9
Young observed per 100 adults	89	-33	-18

An increased breeding population for 1977 was indicated by 1976 harvest statistics.

Indicated production was below 1976 and the average.

The cottontail per mile index was up in northern and central Utah and down in southern and eastern Utah. The index was above average in all of northern Utah.

### Harvest

#### Hunter Questionnaire

Results of the 1977 hunter questionnaire are found in Table 4. Trends of cottontails bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county since 1967 are found in Tables 5-7. Trends of statewide harvest statistics are found in Table 8 and Figure 2. The 1977 season compared to 1976 and the average as follows:

		<u>Percent change from</u>	
	<u>1977</u>	<u>1976</u>	<u>Average</u>
Cottontail hunters	35,831	+26	+41
Cottontail harvest	269,263	+14	+60
Hunter-days afield	157,257	+24	+49
Cottontails per hunter-day	1.71	- 8	+ 6
Cottontails per hunter	7.51	-10	+11

Total hunters, days afield and total harvest all increased from 1976 to record levels. Success declined somewhat but remained above average.

### Field Bag Checks

Results of this survey for 1976 are shown in Table 9. Trends of hunter success as determined by bag checks are shown in Table 10. The 1977 season compared to 1976 and the average as follows:

	<u>1977</u>	<u>Percent change from</u>	
		<u>1976</u>	<u>Average</u>
Total hunters checked	456	-23	+ 1
Total hours hunted	1,375	-27	+ 9
Cottontails per hunter (complete hunts)	1.82	-36	- 3
Cottontails bagged per 100 hours	46	-23	-15
Hours per hunter-day (complete hunts)	3.8	+12	+15
Hours per cottontail bagged	2.2	+83	+10

Fewer cottontail hunters were checked in 1977 than in 1976 but this reflects poor opening weekend weather rather than an actual reduction in hunter pressure. Success decreased and was somewhat below average. Hunters spent more time afield and the time required to bag a cottontail almost doubled. Hunter success increased later on in the season.

## SNOWSHOE HARE

Harvest

During 1977, the third annual snowshoe hare hunting season was held statewide. Results of the 1977 hunter questionnaire are found in Table 11. Trends of snowshoe hares bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) are found in Tables 12-14. The 1977 season compared to the season in 1976 and to the average of the first two hunts as follows:

	<u>1977</u>	<u>Percent change from 1976</u>	<u>Average</u>
Snowshoe hare hunters	9,752	+14	+35
Snowshoe hares harvested	21,232	+37	+54
Hunter-days afield	26,532	+30	+32
Snowshoes per hunter-day	0.80	+ 4	+16
Snowshoes per hunter	2.18	+20	+13

Significant misidentification of white-tailed jackrabbits as snowshoe hares was anticipated prior to mailing the harvest questionnaire following the first season in 1975. This proved to be the case as a significant harvest was reported for Box Elder and Tooele counties; outside the known range of the species. It was assumed that the problem was Statewide, not just confined to those counties.

The 1976 harvest questionnaire was modified in an attempt to better inform respondents concerning the potential for misidentification and aid them in distinguishing between these two varying hares. Comparative reported harvests in Box Elder and Tooele counties between 1975 and 1976 suggest that this was accomplished, at least to a significant degree, but the still relatively large harvest suggests continued substantial confusion. Further refinement was made in the 1977 harvest questionnaire in an effort to more clearly define the snowshoe hare harvest; however, some confusion still exists especially among hunters hunting in Box Elder County.

The estimated number of hunters increased sharply in comparison to 1975 and 1976 and the number of hunter-days afield increased substantially. The indicated total harvest also showed a marked increase. An unknown, ~~portion~~ proportion of the indicated harvest were actually white-tailed jackrabbits.
