"Finding out how many there are left is the least of the purposes of game census.

Measuring the response of game populations to changes - deliberate or accidental - in their environment is the big purpose.

Continuous census is the yardstick of success or failure in conservation."

*Aldo Leopold 1932*

## TABLE OF CONTENTS

# ANNUAL PERFORMANCE REPORT

**State:** UTAH

**Grant Number:** W-16-RD

**Segment:** 2

**Grant Title:** Statewide Upland Game Management Surveys and Inventories

**Grant Agreement Period:** Oct. 1, 1997 thru Sept. 30, 1998

**Abstract:** This report identifies progress and accomplishments of Segment No. 2 objectives, 1997-98. Results of annual population surveys and inventories conducted during the segment W-16-RD-1 and harvest surveys conducted under W-16-RD-2 along with summaries of long-term trends of population indices derived and harvest estimates will be included in the Utah Upland Game Annual Report 1997. Data obtained in 1997 will be compared to 1996 and long-term averages.

The Federal Aid Annual Performance Report for W-16-RD-1 will be included in the Utah Upland Game Annual Report 1997, rather than this Annual Performance Report because of the annual reporting scheme initiated under W-65-R and because of the way population surveys and inventories and harvest data are collected.

Annual population surveys and inventories are collected during one segment and harvest surveys are conducted during the subsequent segment. The Utah Upland Game Annual Report is an attempt to summarize population survey and inventory data and harvest estimates for the same calendar year.

This reporting scheme may seem awkward, especially when one looks at a Utah Upland Game Annual Report and sees a copy of a Federal Aid Annual Performance Report included for a segment that ended before harvest survey data was actually collected.

Because this reporting scheme is somewhat confusing, but makes the most sense from a biological perspective to report population survey and inventory information for the same calendar year as harvest, it is hoped that the above explanation clarifies any confusion. Further, it is recommended that the reporting scheme remain the same.

The 1997 Utah Upland Game Annual Report (includes survey and inventory data from W-16-RD-1 and harvest data from W-16-RD-2) will be published in January 1999 and the 1998 Utah Upland Game Annual Report (includes survey and inventory data from W-16-RD-2 and harvest data from W-16-RD-3) will be published in March 1999.

## **I. OBJECTIVES OF GRANT PROPOSAL:**

1. To annually monitor and evaluate 16 upland game species harvest and populations in Utah using appropriate surveys and inventories--on-going objective.
2. To administer Utah's upland game programs and to manage 16 upland game species based on population data obtained through Objective 1--on-going objective.
3. In conjunction with the Utah State University Extension Fisheries and Wildlife Specialist, compile, develop and publish a handbook pertaining to field identification, basic biology and ecology and sexing and aging techniques for Utah upland game.

## **Progress Statement and Summary of Work Completed During The Segment For Each Objective:**

1. To annually monitor and evaluate 16 upland game species harvest and populations in Utah using appropriate surveys and inventories.

**ANNUAL PERFORMANCE REPORT**

**UTAH W-16-RD STATEWIDE UPLAND GAME MANAGEMENT SURVEYS AND INVENTORIES**

**Ongoing Objective.** Annual inventory procedures for ring-necked pheasants included winter sex ratio counts and summer roadside counts. The winter sex ratio counts were conducted from December 15, 1997 through February 10, 1998, as snow cover conditions allowed. Indices derived include hen-cock ratios and pheasants observed per 100 hours. Annual summer roadside counts (three or more per route) were conducted from July 22-August 22 on permanently established routes. Indices derived include pheasants per mile, young per mile, young per hen, mean brood and percent of hens with young. Pheasant crowing territory counts were selectively conducted by DWR's northern and central regions. Crowing territory counts are used by biologists to determine if habitat improvement projects are successful in increasing populations, and also as another index to local pheasant breeding populations.

Mourning dove breeding population trend was determined via the annual call count survey. This survey is part of a nationwide survey administered by the U. S. Fish and Wildlife Service. Call counts are conducted over 15 permanent, 20-mile routes. One count was made on each route between May 20-30, 1998.

Random brood counts were conducted on chukar and Hungarian partridge, forest grouse (ruffed and blue), sage grouse, sharp-tailed grouse, wild turkey and quail from June 15-August 22. Indices derived for each species include mean brood size, young per 100 adults and birds observed per 100 hours of effort.

Sage grouse strutting ground counts and sharp-tailed grouse dancing ground counts were conducted from March 15-May 15. Total cocks counted, average cocks per ground and percent change from 1997 for comparable grounds were determined on a county basis.

The Gambel's quail long period waterhole counts were completed in July and August. Limited valley quail random brood counts were made in several counties.

Cottontail rabbit roadside counts were conducted over pre-established routes between July 15 and August 22. Indices derived include rabbits per mile and young per 100 adults.

Harvest questionnaires were mailed to determine the harvest of upland game birds, cottontail rabbit, and snowshoe hare. A sample of eligible licensees from the current year's (1997) resident small game license file and 1997 combination license file was used. The modified computerized pull-apart mailer was again used to obtain harvest data. Separate questionnaires were mailed to all ptarmigan, band-tailed pigeon and wild turkey permittees. Indices derived include total hunters, hunter-days, total harvest and hunter success per day, plus success for each season.

The upland game questionnaires were processed by the Utah Division of Wildlife Resources Public Services Section. Wild turkey, band-tailed pigeon and ptarmigan questionnaires were analyzed separately by Utah Division of Wildlife Resources Wildlife Section personnel.

Upland game hunters were checked at checking stations, and random field checks were made during each hunting season. Indices derived include bag per hunter (per day), bag per 100 hours, average hours per hunter-day and average hours per bird bagged. Additional sex and age composition data were compiled for some species using wing samples collected at checking stations.

One ten mile helicopter transect was flown in Utah's west desert in August, 1997 to determine chukar population densities. Index derived was chukars per mile. This survey is flown only in Utah's west desert and nowhere else in Utah.

The winter flock count survey for wild turkey was partially implemented during the winter 1997-98 and will be fully implemented during the winter, 1998-99.

No new sage or sharp-tailed grouse leks were described or mapped during the segment.

**ANNUAL PERFORMANCE REPORT****UTAH W-16-RD STATEWIDE UPLAND GAME MANAGEMENT SURVEYS AND INVENTORIES**

The project leader worked closely with the waterfowl program coordinator and agency planner in scoping and deciding how best to collect Utah migratory bird hunter data for the federal Migratory Bird Harvest Information Program (HIP) to come on line in 1998. Migratory bird hunters were required to telephone a 1-800 number to register for HIP. The 1998 Utah Legislature authorized a one dollar license fee increase for all small game and combination licenses in an effort to generate revenue for implementing HIP. The license fee increase will go into effect January 1, 1999.

Completion of the 4-Corners Band-tailed Pigeon Management Plan continues to wane. Several sections of the plan are being submitted by outside authors to the project leader who serves on and off as the plan's editor. Personnel changes in other states and higher priority projects in Utah and in the states of Arizona, Colorado and New Mexico have delayed the completion of the plan indefinitely. Further discussion on plan completion will occur at the March (1999) Pacific Flyway Regulations Meeting.

**2. Ongoing Objective.** To administer Utah's upland game programs and to manage 16 upland game species based on population data obtained through Objective 1.

Data collected in Objective 1 was used by DWR personnel to formulate harvest recommendations for 16 species of upland game in Utah. DWR personnel met in April, 1998 to formulate harvest recommendations for fall 1998 upland game seasons. DWR recommendations were presented at 5 Regional Advisory Councils and the public throughout the state in May. In June, recommendations were presented to the Utah Wildlife Board who made final decisions for recommendations to include in the 1998-99 Utah Upland Game Proclamation.

In September, October and November, 1998, the project leader also presented DWR recommendations for wild turkey conservation permits and limited entry turkey hunting unit permits to 5 Regional Advisory Councils, the public and the Utah Wildlife Board.

**3. Objective To Be Completed Over 2 Years.** In conjunction with the Utah State University Extension Fisheries and Wildlife Specialist, compile, develop and publish a handbook pertaining to field identification, basic biology and ecology and sexing and aging techniques for Utah upland game.

Objective 3 was not implemented in this segment. The Grant Agreement budget for Objectives 1 and 2 was underestimated and used up the funds intended for Objective 3. The apportionment for Wildlife Restoration Act funding was insufficient to increase the segment budget for Objective 3 and the task could not be implemented with only state funds which were also insufficient. We will continue to apply for sufficient funding, if available, otherwise this objective may not be accomplished in the Grant Period.

**Location of Work Performed:** Statewide.

**Actual Cost:**

## **INTRODUCTION**

The objective of Utah's upland game management program is to provide recreational hunting opportunity for sportsmen within the limits of the annual harvestable surplus for each species. It is based on the knowledge that populations of upland game experience relatively high rates of annual turnover. High reproductive rates are naturally compensated for by high death rates, whether hunting is allowed or not. Annual surveys are conducted to measure the production, trend and harvest of each upland game population.

This is the twenty-eight addition of this Annual Upland Game Report. It is an annual performance report of information compiled during inventory and harvest surveys conducted under Federal Aid Project W-16-RD. Information contained herein was collected and compiled by conservation officers, biologists, wildlife managers and the upland game management staff of the Utah Division of Wildlife Resources.

This report serves as a handbook of inventory and harvest data. It is designed primarily for the use of those concerned with the management of upland game. A separate section is devoted to each species of upland game in Utah. Data are presented primarily in tabular form with limited narrative comment. The first page of each section provides a brief summary of population status and trend as indicated by inventory and harvest data.

During 1998, a total of 50,740 Utah sportsmen spent 338,674 days afield in pursuit of various upland game species (Table 1). The harvest of upland game totaled 386,395 animals. The proportion of the total upland game hunters which pursued each species is shown in Table 2 and the percentage failing to bag at least one bird (from the general mail harvest questionnaire) of each species in Table 3.

The regulations for 1998 upland game hunting seasons are shown in Appendix D.

# GENERAL HARVEST QUESTIONNAIRE

Harvest statistics were obtained from a random sample of licensed hunters by their response to a hunter harvest questionnaire. The combined upland game bird and rabbit-hare mail harvest questionnaire was again used.

A total of 14,497 upland game questionnaires, a 15.85 percent sample of Utah's potential upland game hunters, were mailed. Of the total, 1,492 (10.29%) questionnaires were undeliverable. Of the 13,005 questionnaires delivered, 3,862 (29.70 %) useable upland game questionnaires were returned. Of those, 1,681 purchased a license but did not hunt upland game. By dividing the total of 89,848 eligible licensees by the usable returns (3,862), a projection factor of 23.264629 is derived.

The 1998 hunter questionnaire sample size was greater than 10 percent of the total hunter population, so a follow-up questionnaire was not sent to those who failed to return the first one. A high rate of return is desirable in order to obtain an adequate sample of harvest estimates in counties where hunting pressure and harvest are limited. Extremely small samples from these counties tend to over-estimate the harvest and thus bias the results. Although harvest, number of hunters and days-afield may be over-estimated where small samples are obtained, harvest per hunter-day should be relatively precise.

**Table 1. Summary of harvest statistics from the general mail questionnaire for 1998.**

<b>Species</b>	<b>Hunters</b>	<b>Total</b>	<b>Hunter-Days</b>	<b>Bag Per</b>	<b>Bag Per Hunter</b>
	Afield	Harvest	Afield	Hunter-Day	For Season
Pheasant	35,130	77,889	126,792	0.61	2.22

Total Hunters**	64,868	61,922	58,423	59,590	49,518	55,159	57,401	54,125	50,740											

\*Although wild turkey, sharp-tailed grouse, band-tailed pigeon and white-tailed ptarmigan harvest was determined by separate questionnaires, it is assumed that these hunters are derived from the same group of hunters who reported hunting other upland game bird species.

\*\*This is not the total of the columns because many upland game hunters hunted more than one species.

AVERAGES (1961-97)	33		14		49		39		35		35		39		35		39		45		

The upland game questionnaire is designed to monitor statewide harvest trend from year to year. The more extensively a species is hunted, the more accurately the questionnaire measures the trend data. In an effort to improve the accuracy of indices for species which receive very little hunting pressure and harvest, and which have low densities and limited distribution, a unique questionnaire for that species is mailed to the permit holder. This method has been used for band-tailed pigeon, wild turkey, sharp-tailed grouse and white-tailed ptarmigan.

The annual harvest report is sometimes criticized for being inaccurate and without value. However, report users must recognize that the accuracy of the questionnaire is based on some basic assumptions. These assumptions are: (1) the returned useable sample is a completely random sample, (2) respondents recorded data correctly, i.e., they clearly understood the questionnaire, (3) respondents recorded data accurately, did not guess or lie, and (4) respondents correctly identified species hunted. If these assumptions are not met, projections of harvest by county may be over-estimated due to nonrespondent or memory biases. Extreme caution should be used in the interpretation of estimated harvest and hunters for specific species in specific counties. Rather, the long-term trend in these indices should be used in managing the populations.

Presently, the Upland Game Annual Report contains the best data available and therefore constitutes the basic facts of upland game management. Although this report has its limitations, the trend data is valuable in making professional judgments regarding upland game populations and harvest.

The annual report is used in wildlife planning. It can be used to establish relative importance among species and for developing new resources through transplants or habitat developments. It points out areas of needed research by indicating problems and possible causes. It documents population trends and it combines all this inventory information into one easily accessible publication. Thus it is used extensively by federal land management agencies in environmental impact statements and management plans. It will become increasingly more important in developing management plans and assessing impacts on wildlife habitat.

## Pheasant

The 1997-98 winter was fairly mild. Temperatures were above normal in January through March, while precipitation was below normal in October through December.

During the nesting season, statewide monthly average temperatures were below normal (April-June). Average precipitation was above normal (April-July). Pheasants observed on roadside routes was above 1997, but young per hen and the percentage of hens with young was less than in 1997.

Harvest statistics compiled from the questionnaire indicated a decrease in success compared to 1997. Harvest decreased 1 percent from 1997, and remained 60 percent below the long-term average. However, opening weekend success was up compared to the previous year based upon field bag check data.

The pheasant hunt is the most popular upland game hunt in Utah. Despite its popularity among Utah sportsmen, Utah's pheasant population continues to decline steadily. Primary reasons for population declines are due to outright losses of critical habitat and degradation of remaining habitat.

Beginning in 1997, one special youth (ages 12-15) youth pheasant hunt was provided in conjunction with the Box Elder County Cooperative Wildlife Management Unit. Approximately 75 youth hunters, recent graduates from Utah Hunter Education classes, participated in the hunt held on private property during the second Saturday of Utah's general pheasant season. The hunters were divided and allowed to go afield during a morning and afternoon hunt. Pen-reared pheasants were released prior to each hunt. Youth hunters were allowed to go afield, accompanied by a guardian, and had the opportunity to harvest two cock pheasants. Approximately 50% of the released pheasants were harvested.

Prior to going afield, youth hunters were provided with rules for the hunt and safety and ethics training. Upon returning from the field, youth hunters were provided with demonstrations on proper field dressing and game care.

In 1998, two youth pheasant hunts were provided-one on the Willard Bay and one on the James Walter Fitzgerald Wildlife Management areas. Hunts occurred on the second Saturday of the general pheasant season. Each wildlife management area (WMA) was closed to the general public during the youth hunts. A total of 200 youth hunters (100 at each WMA) participated in the 1998 hunts.

The Conservation Reserve Program (CRP), begun in 1985 and reauthorized in 1996, has done little for Utah pheasant populations. Most CRP lands in Utah are in dryland farming areas. Pheasants prefer irrigated agricultural areas.

## Breeding Territory Counts

Spring pheasant breeding territory counts have been conducted sporadically since 1993. Data on the number of territorial males per square mile are shown in Table 16. The number of territorial males in 1998 was up 73.14 percent over the 1993-97 average.

## Winter Sex Ratio Counts

Winter sex ratio counts provide an index as to how harvest of roosters only is affecting pheasant populations. In Utah, one rooster for every two, three or four hens is most common. One rooster for every ten hens is biologically acceptable in that one rooster can easily service ten hens in the wild. Based on this biological concept, hunting of rooster pheasants only does not appear to be affecting the populations.

Results of the survey for the winter of 1997-98 and long-term trends are shown in Tables 1 and 2 of this section. Statewide comparisons to the winter of 1996-97 and the 10-year (1988-97) average are as follows:

	<u>Percent change from 1996-97</u>	<u>Percent change from Average</u>
<u>Winter of 1997-98</u>		
Total pheasants counted (roadside)	--	--
Hens per cock	--	--
Pheasants observed per 100 hours	--	--
Total hours effort (roadside)	--	--

Due to increased demands on biologist's time, winter sex ratio data was not collected in Utah in the winter of 1997-98.

## Roadside Counts

A summary of summer roadside pheasant counts for 1998 is shown in Table 3. Long-term trends of pheasants per mile, young per mile, young per hen, percent of hens with young and mean brood size are found in Tables 4-8. Summer 1998 survey results compared to 1997 and the 10-year (1988-97) average follow:

	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
<u>1998</u>		
Total pheasants observed	608	+94
Total miles driven	1,066	+40
Pheasants per mile	0.57	+39
Average brood size	5.02	+12
Young per hen	3.53	-6
Percent of hens with young	69	-19

Total pheasants observed increased 94 percent and pheasants per mile increased 39 percent. Percent of hens with young decreased 19 percent while average brood size increased 12 percent.

More pheasants were observed on roadside counts in 1998 than in 1997. However, reproductive success per adult hen and percentage of hens with young was down from the previous year. Lower than normal temperatures and increased precipitation during the nesting season (April-June) may have been responsible for decreased chick survival.

## Harvest

### Hunter Questionnaire

Results of the hunter questionnaire for 1997 are shown in Table 9. Long-term trends of pheasants bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 10-12, and total statewide harvest statistics in Table 13. A comparison of 1998 harvest statistics to 1997 and the previous 50-year average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Pheasant hunters	35,130	-7	-52
Pheasants harvested	77,899	-1	-60
Hunter-days afield	126,792	-10	-39
Pheasants per hunter-day	0.61	+9	-31
Pheasants per hunter	2.22	+6	-13

Total hunters decreased 7 percent from 1997 and remained 52 percent below the long-term average. Total harvest decreased 1 percent from 1997. Hunter success (pheasants per hunter-day) increased 9 percent from 1997. Pheasants per hunter increased 6 percent and remains 13 percent below the long-term average.

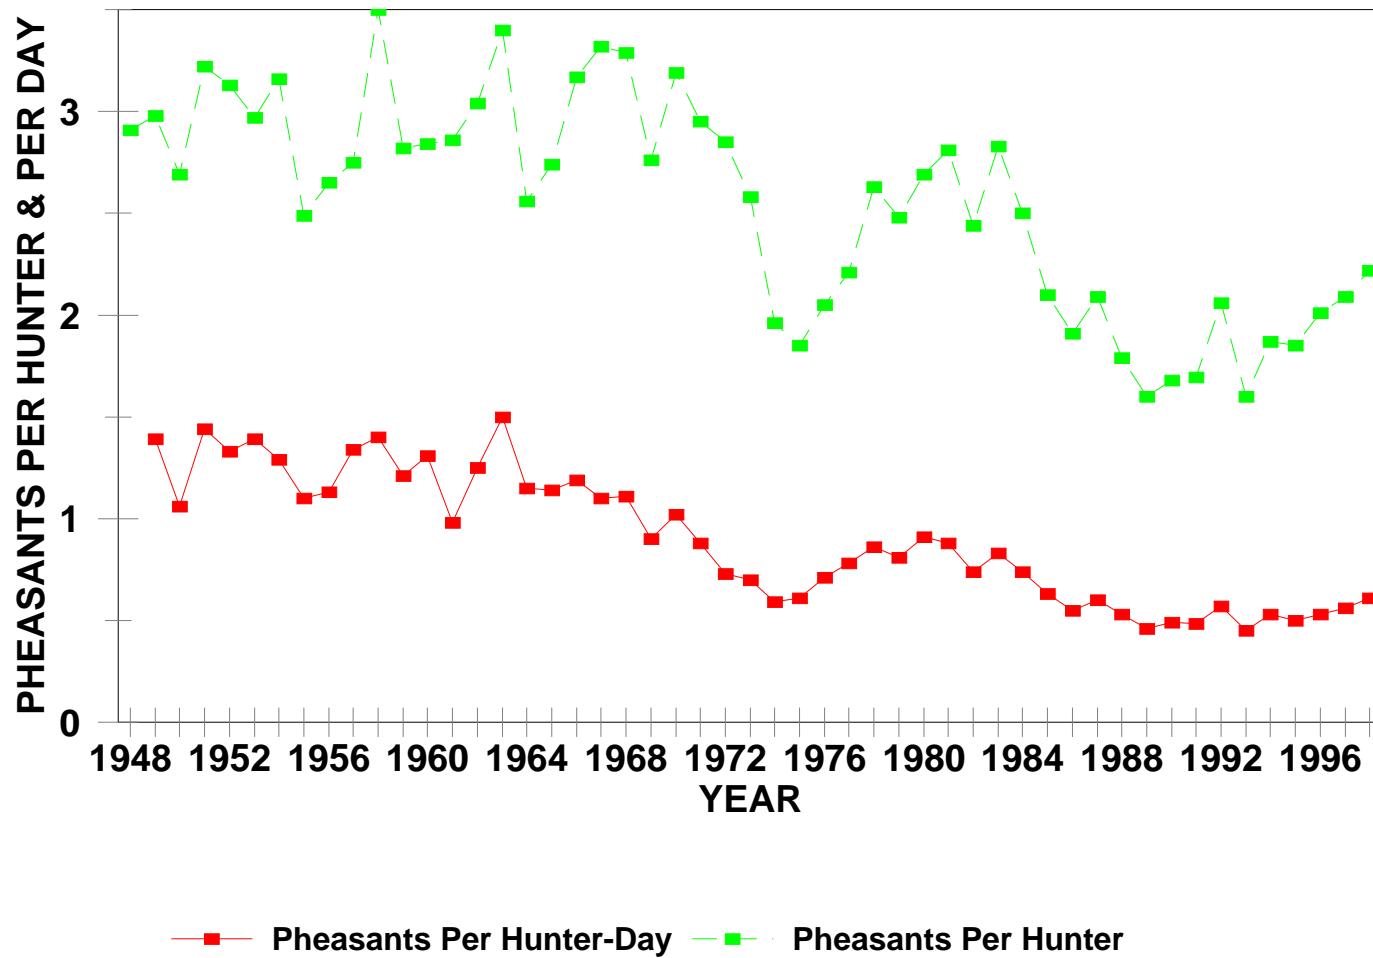

Long-term trends (1948-97) of total hunters, hunter-days, harvest and hunter success are shown in Figures 3 and 4. Generally, the recent trend is toward less hunter-days with declines in total pheasants harvested and hunter success. We believe this is the result of the accumulated effects of loss of quantity and quality of habitat due to urbanization, flooding, modern agricultural practices, and habitat fragmentation resulting in increased predation.

Cache County accounted for 19.21 percent of the entire pheasant harvest, while Utah County accounted for 18.64 percent and Box Elder County for 12.43 percent.

**Figure 1. Statewide trends of pheasant harvest statistics, 1948-98.**

**Figure 2. Statewide trends of pheasant  
hunter success rates, 1948-98.**

## Field Bag Checks

Field bag checks provide an index of opening day or weekend hunter harvest success rates.

A summary of pheasant field bag check data for 1998 is shown in Table 14. The hunter success trend determined via bag checks since 1992 is found in Table 15. A comparison of 1998 data, on a statewide basis, to 1997 and the 10-year (1988-97) average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Total hunters checked	195	+39	-77
Total hours hunted	397	+32	-83
Pheasants per hunter (complete hunts)	0.46	+28	+28
Pheasants bagged per 100 hours	24	+41	+48
Average hours per hunter-day (complete hunts)	1.91	-11	-22
Hours hunted per pheasant bagged (complete hunts)	4.12	-19	-36

In 1998, hunters spent 11 percent less time afield on an average day during the opening weekend. Hours hunted per pheasant bagged decreased 19 percent. However, pheasants per hunter increased 28 percent over 1997 and remained at 28 percent above the 10-year average.

## Migratory Upland Game Birds

**Mourning Dove**

The breeding density index decreased 52 percent in 1998, and was 46 percent below average.

Harvest statistics derived from the questionnaire indicated an increase in number of hunters and harvest compared to 1997.

Beginning in 1998, Utah mourning dove and band-tailed pigeon hunters were required to register under the federally mandated, Migratory Game Bird Harvest Information Program (HIP). The purpose of HIP is to ensure standardized harvest data collection for migratory game birds. HIP is administered by the U.S. Fish and Wildlife Service.

Field bag checks indicated a decrease in hunter success on opening day. Hunters who participated hunted more hours per day than the previous year, and spent more time afield per dove harvested.

Aging of wings indicated the juvenile per 100 adult ratio increased to 120 compared to 116 in 1997. Juvenile per 100 adult ratio was 22 percent above the long-term average.

### **Band-tailed Pigeon**

A free band-tailed pigeon hunting permit was required in 1998 to obtain mailing addresses for a harvest questionnaire. Pigeon hunters were also required to register in the HIP program. One hundred thirty-five hunters obtained permits and 68 went afield. Sixty-seven pigeons were harvested. The majority of the harvest occurred in Washington County.

# MOURNING DOVE

## Call Count Survey

Results of the 1998 call count survey are found in Table 1 of this section. The long-term trend of the state's breeding density index (average doves heard per route) is shown in Table 2. Indices shown in each of these tables are unweighted and consequently differ from those published in the annual Mourning Dove Status Report compiled by the U.S. Fish and Wildlife Service. However, indicated trends are similar (Figure 1). The following is a comparison of the results of the 1998 survey compared to 1997 and the 10-year(1988-97) average:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Average doves heard per route	5.33	-52	-46
Average doves seen per route	3.33	-51	-66

Coo count data (doves heard per route) indicated substantially decreased breeding activity in late May compared to 1997, and was 46 percent below the long-term average of doves heard per route.

## Harvest

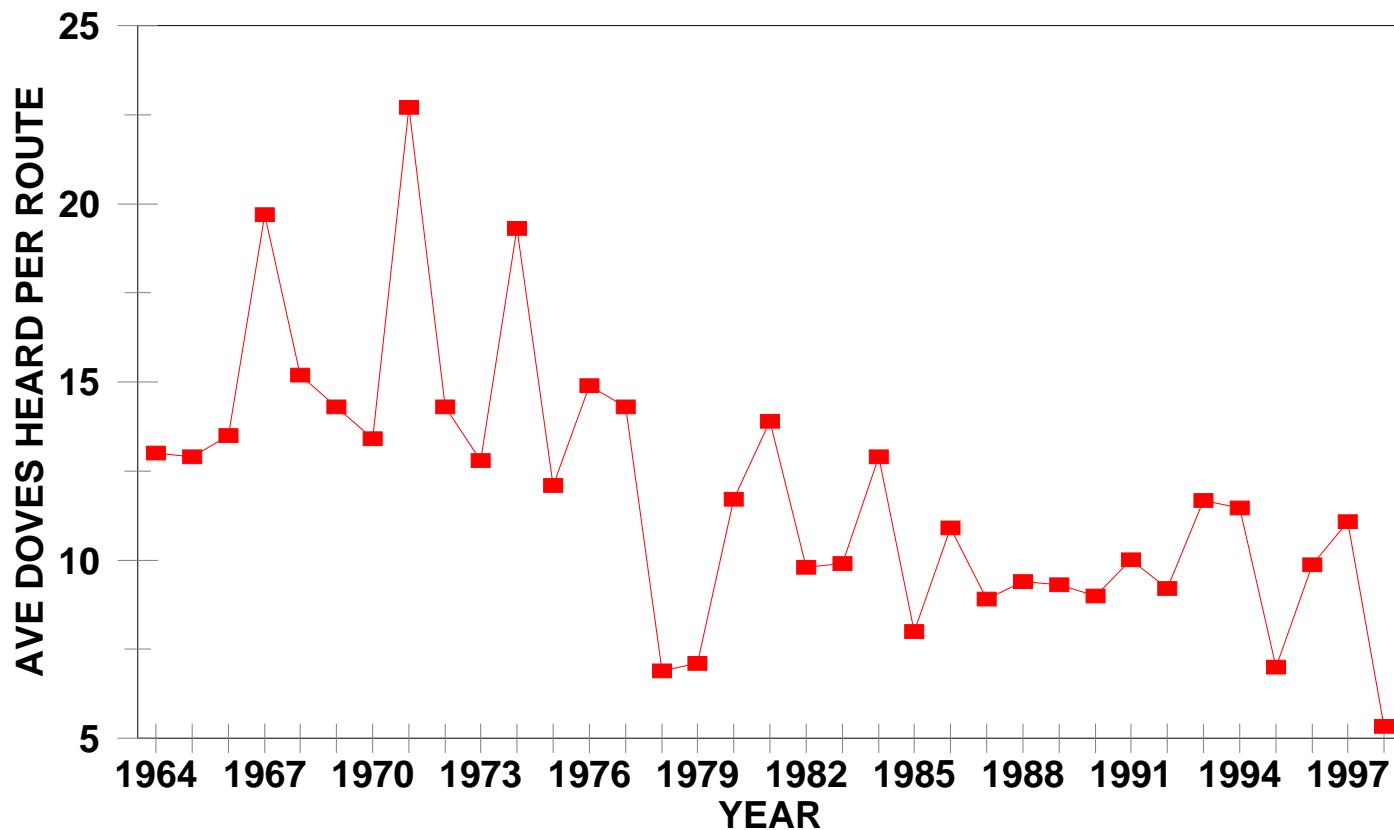

### Hunter Questionnaire

Information obtained from the hunter questionnaire for 1998 is summarized in Table 3. Long-term trends of mourning doves bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 4-6 and total statewide harvest statistics in Table 7 and Figures 2 and 3. The following is a comparison of the harvest statistics for 1998 compared to 1997 and the previous 47-year average:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Mourning dove hunters	18,030	-20	-18
Mourning doves harvested	160,014	-23	-22
Hunter-days afield	67,234	-21	-4
Mourning doves per hunter-day	2.38	-3	-26
Mourning doves per hunter	8.87	-5	-2

Hunter success decreased from 1997. Total harvest decreased 23 percent compared to 1997. Numbers of dove hunters decreased 20 percent and hunter-days afield decreased 21 percent. Doves per hunter decreased 5 percent from 1997.

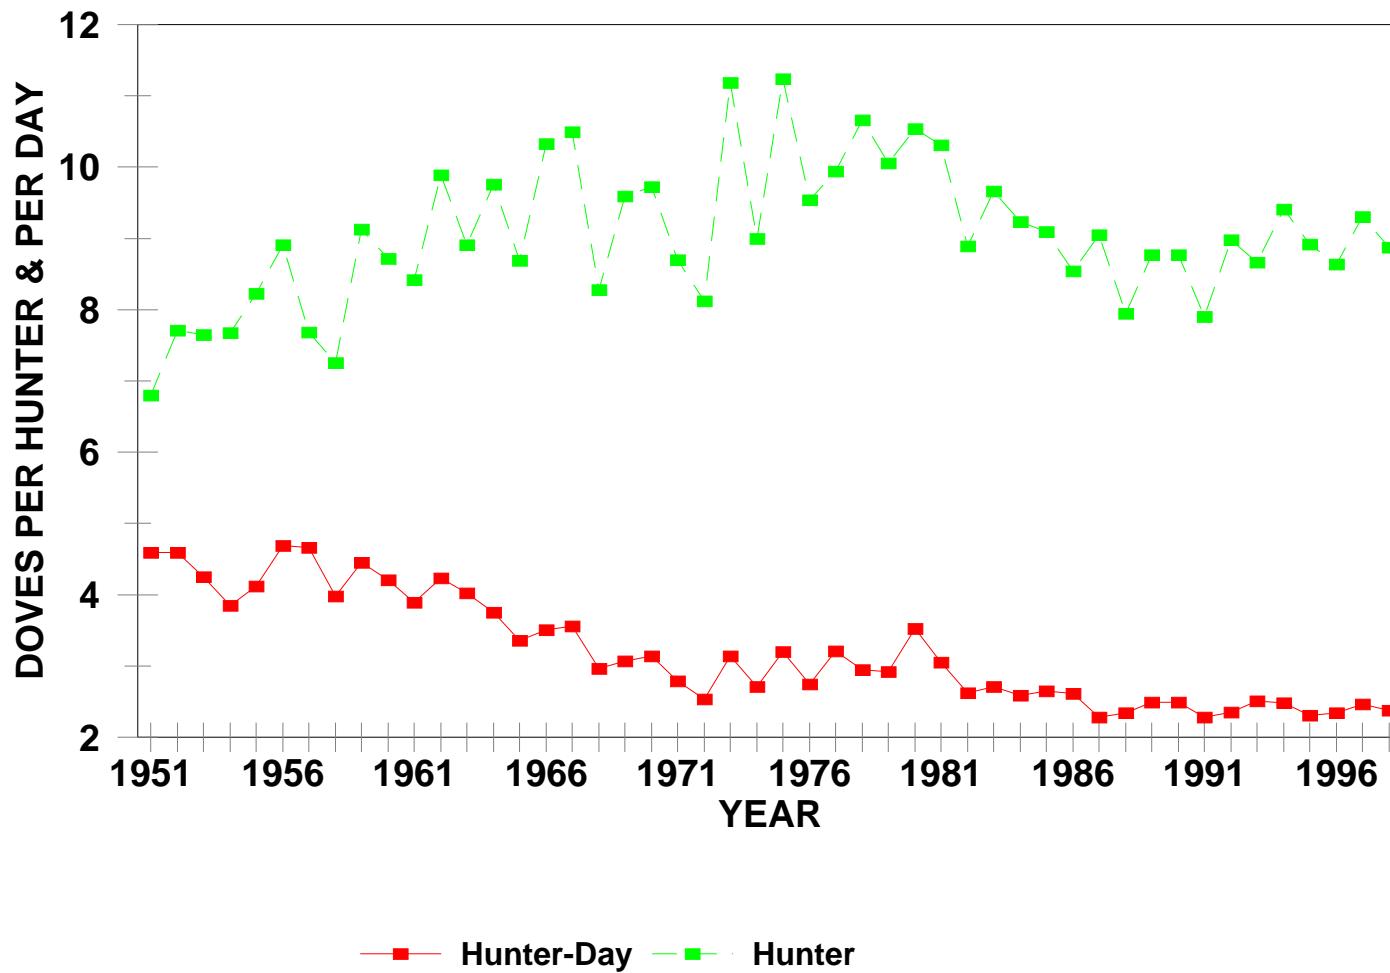

**Figure 1. Mourning dove breeding density index trend, 1964-98.**

**Figure 2. Statewide trends of mourning dove harvest statistics, 1951-98.**

**Figure 3. Statewide trends of mourning dove hunter success rates, 1951-98.**

## Field Bag Checks

A summary of field bag check data for 1998 is shown in Table 8. Hunter success trends determined via this method are shown in Table 9. Results of the 1998 survey compared to 1997 and the 10-year average (1988-97) follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Total hunters checked	493	-7	-42
Total hours hunted	1,501	-13	-53
Doves per hunter (complete hunts)	1.75	-6	-38
Doves bagged per 100 hours (complete hunts)	44	-23	-41
Average hours per hunter-day (complete hunts)	3.96	+21	+4
Hours hunted per dove bagged (complete hunts)	2.26	+12	+61

Field bag checks indicated an opening day decrease in hunter success. The total number of hunters checked was down 7 percent from 1997. Dove hunters spent more time afield per hunter-day than in 1997, and more time was spent per dove bagged.

## Age Composition of the Harvest

A summary of the age composition of harvested mourning doves from 1988 through 1998 is contained in Table 10. Hatching dates for immature doves harvested in Utah since 1989 are shown in Table 11.

Following is a comparison of data collected in 1998 compared to 1997 and the 10-year average (1988-97) :

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Sample size	620	-62	-63
Immatures/100 adults	120	+20	+22
Percent hatched August 3+	55	+20	+22
Percent hatched July 25+	84	-3	+37
Percent hatched before July 25	16	+18	-22

Sample size decreased 62 percent in 1998. The 120 immatures per 100 adults in the harvest was up 20 percent from the previous year and is 22 percent above the long-term average.

# BAND-TAILED PIGEON

## Banding

Between 1969 and 1978, 2,649 total pigeons were banded in Utah and 975 recaptured. Results of banding efforts through 1972 indicated a direct recovery rate of 1.4 percent. If expanded, using an assumed 30 percent band reporting rate, an estimated harvest rate of less than 5 percent of the state's pigeon population is indicated. Addition of an estimated 16 percent crippling loss would result in a total kill rate of from 5-10 percent, well within the harvestable surplus.

## Harvest

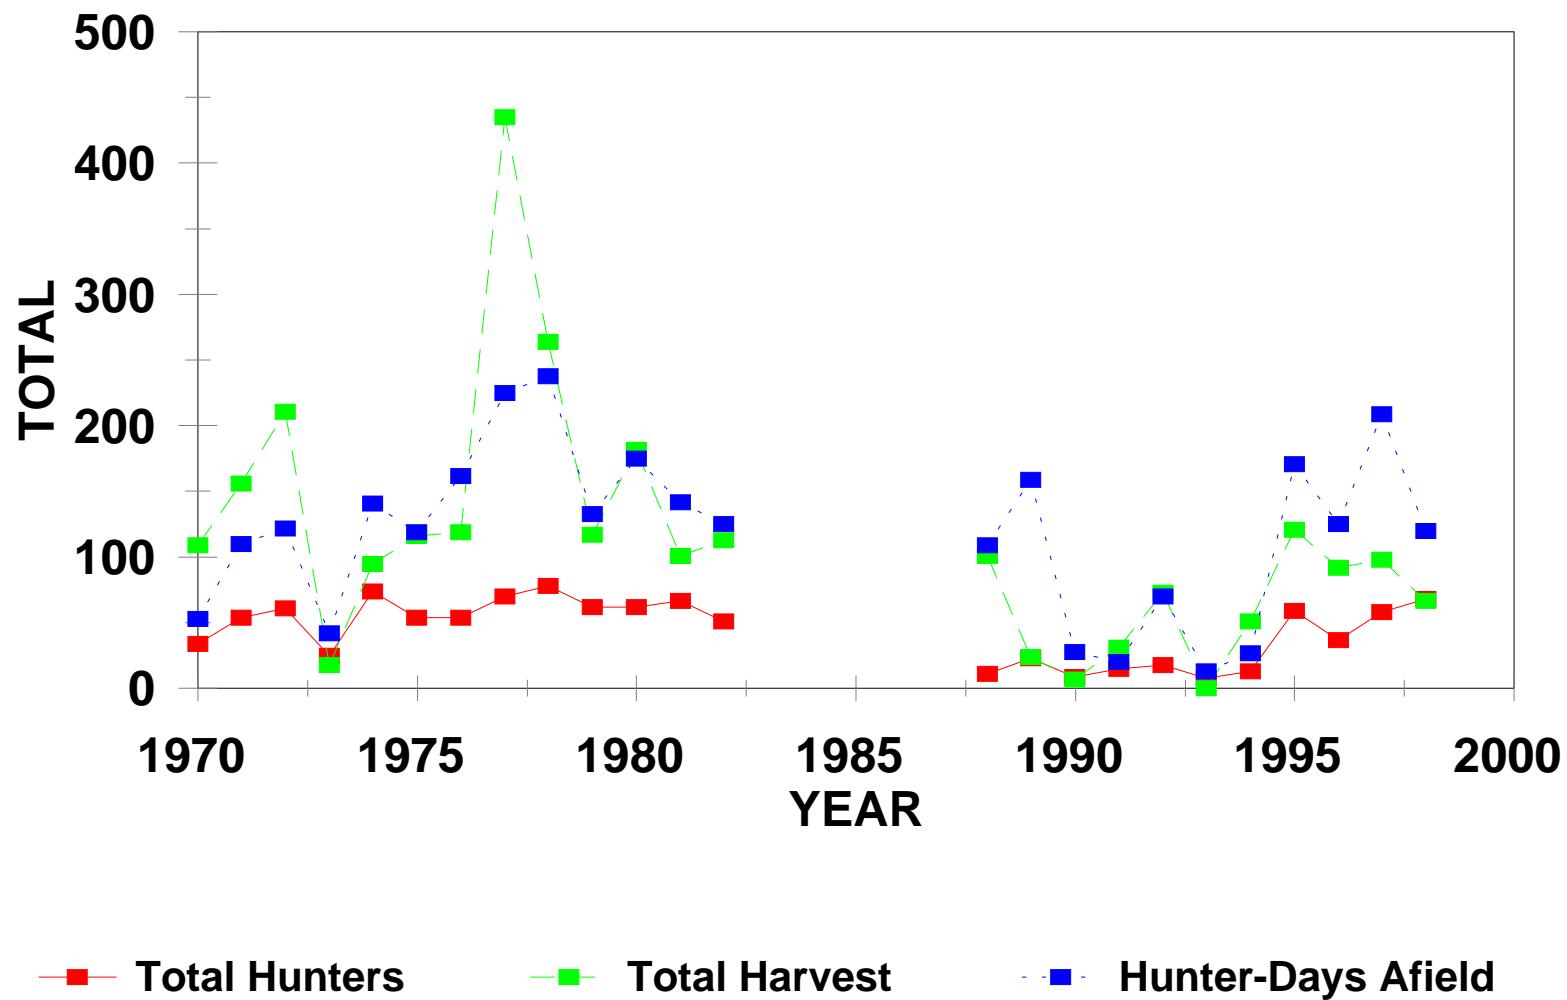

Results of the 1998 band-tailed pigeon harvest is in Table 13. Free hunting permits were required in 1998 as well as registration in the HIP program. A harvest questionnaire was sent to participants. Only 68 hunters obtained the band-tailed pigeon permit in 1998. Harvest trends since 1970 are shown in Figures 4 & 5 and Table 14.

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Band-tailed pigeon hunters afield	68	+17	+57
Band-tailed pigeon harvest	67	-32	-41
Hunter-days afield	120	+40	+2
Pigeons per hunter-day	0.56	+19	-42
Pigeons per hunter	0.99	-41	-63

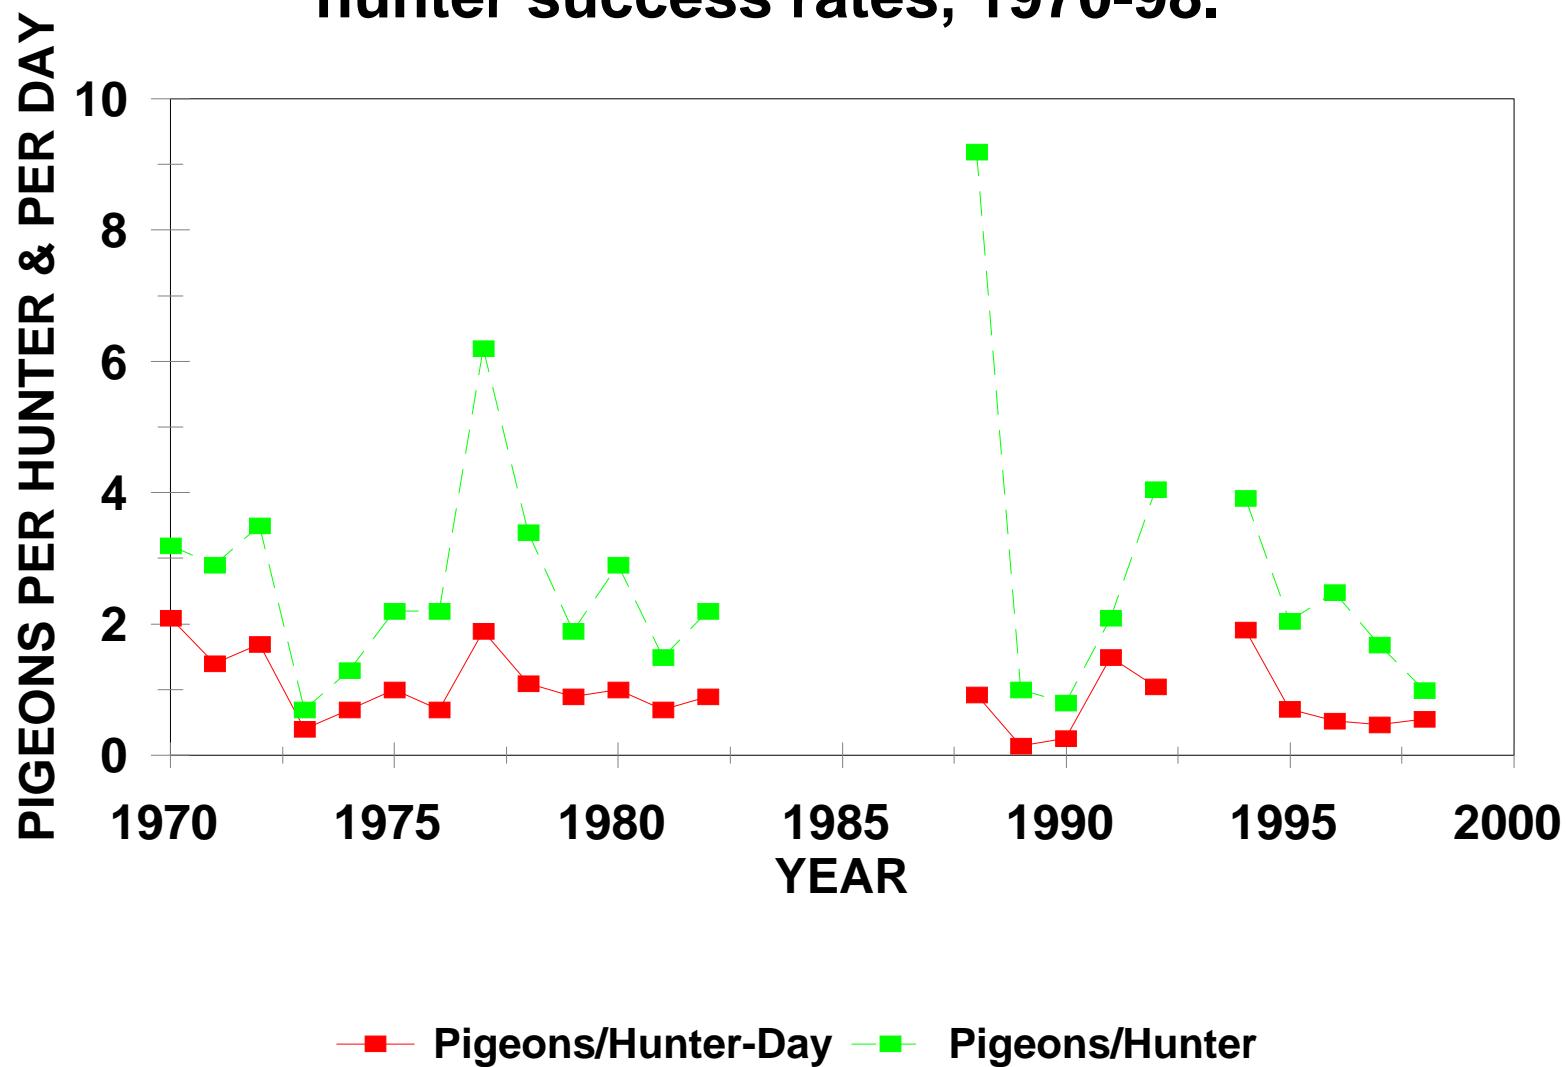

Band-tailed pigeon hunters afield increased from 1997, and was 57 percent above the long-term average.

Sixty-seven pigeons were reported harvested in 1998.

**Chukar Partridge**

CLARK BRONSON

Late winter and early spring precipitation, critical to successful chukar production, was slightly above normal in 1998 (Figure 3).

Results of the aerial survey indicated that chukars per square mile was up 218 percent over 1997.

Harvest statistics from the general mail questionnaire reflected a 51 percent increase in harvest by 4 percent fewer hunters than in 1997. Hunter success (chukars per hunter-day) increased 58 percent from 1997 while time afield decreased 5 percent.

## Aerial Survey

Results of the annual aerial survey for 1998 are shown in Table 1 of this section. Following are the survey results for 1998 compared to 1997 and the 1996-97 average.

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Coveys flushed	52	+189	+247
Total chukars observed	939	+218	+372
Chukars per square mile	117.38	+218	+345
Chukars per survey hour	695.56	+176	+309

This population survey technique was implemented in 1996. The survey allows for rapid counting of localized chukar populations versus ground brood count surveys. Chukars observed per square mile increased 218 percent over 1997. Chukars observed per survey hour increased 176 percent over 1997.

## Harvest

### Hunter Questionnaire

Results of the hunter questionnaire survey for 1998 are shown in Table 2. Long-term trends of chukars bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 3-5 and total statewide harvest statistics in Table 6 and Figures 1 and 2. Following is a comparison of 1998 harvest statistics to 1997 and the previous 40-year average:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Chukar hunters	9,283	-4	-31
Chukars harvested	36,013	+51	-2
Hunter-days afield	33,082	-5	-19
Chukars per hunter-day	1.09	+58	+26
Chukars per hunter	3.88	+57	+45

Chukar hunters and hunter effort decreased from 1997. Chukars per hunter-day increased 58 percent from 1997 and was 26 percent above the long-term average. Total harvest increased 51 percent in 1998.

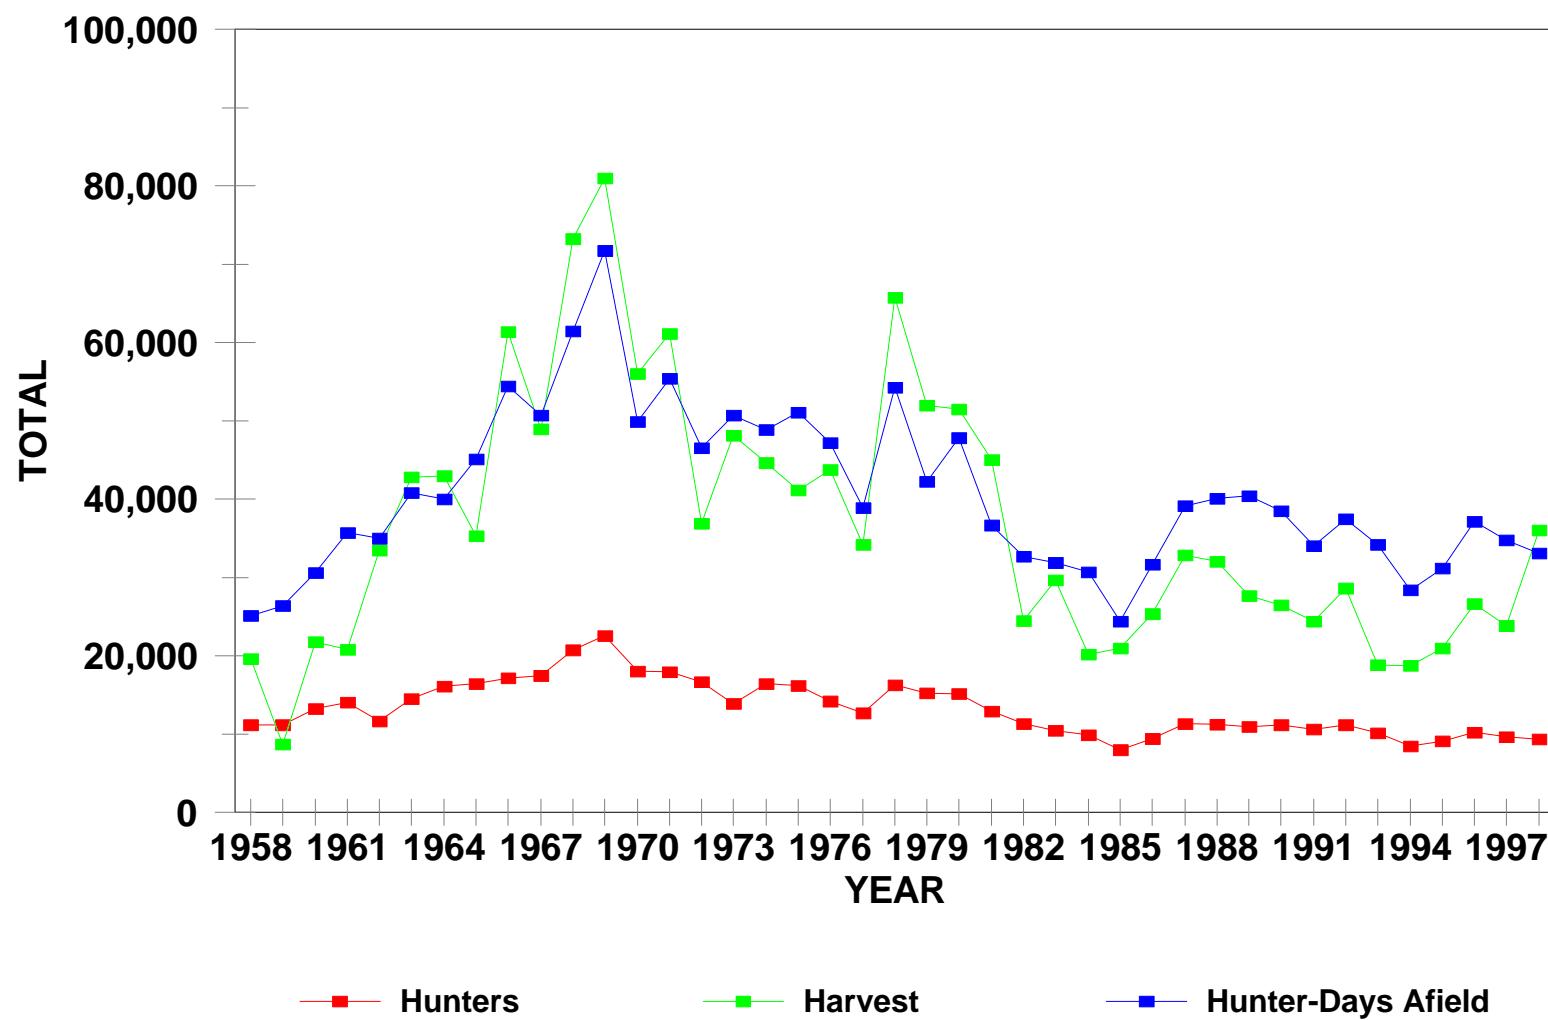

## Field Bag Checks

A summary of field bag check data for 1998 is shown in Table 7. The hunter success trend determined via this method are shown in Table 8. Data for the 1998 season compared to 1997 and the 10-year (1988-97) average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Total hunters checked	87	+71	+91
Total hours hunted	326	+70	+89
Chukars per hunter (complete hunts)	0.96	+68	-42
Chukars bagged per 100 hours (complete hunts)	28	+87	-38
Average hours per hunter-day (complete hunts)	3.47	-7	-11
Hours hunted per chukar bagged (complete hunts)	3.61	-51	+11

Total hunters checked in 1998 increased over 1997. Chukars bagged per 100 hours increased 87 percent over 1997, but remained 38 percent below average.

**Figure 1. Statewide trends of chukar partridge harvest statistics, 1958-98.**

**Figure 2. Statewide trends of chukar  
hunter success rates, 1958-98.**

CLARK BRONSON

## Sage Grouse

Strutting ground count surveys indicated a 41 percent increase in the average male grouse attendance from 1997.

Brood surveys showed increased production per 100 adults throughout the state. Birds observed per 100 hours increased 165 percent from 1997, and was 211 percent above average.

Harvest was 57 percent below the long-term average. Hunter numbers decreased 15 percent in 1998 and remained 51 percent below the long-term average.

Age ratios derived from wings indicated a 45 percent decrease in young per 100 adults and a 44 percent decrease in young per 100 adult hens.

Since 1959, numerous new strutting grounds have been discovered throughout Utah. However, average number of male grouse per ground has declined.

Recent DNA and physiological studies indicate that two distinct species of sage grouse exist in Utah. The smaller species is located south and east of the Colorado River and is known as the Gunnison sage grouse.

Declines in sage grouse populations are attributed to loss and changes in sage brush habitats throughout the West. Spraying, urban and industrial development, burning and overgrazing by domestic livestock have altered critical sage grouse habitat.

Based on studies conducted in Utah in the early 1970s, estimated harvest of the sage grouse population was 20 percent (within the harvestable surplus). The amount of pressure on sage grouse populations was more than double what it is currently. Hunting pressure at current levels is not affecting populations.

There is much discussion about the status and future of sage grouse at the "Western States" level. Utah should place high priority on collecting as much annual biological data as possible on sage grouse populations in order to make the best management decisions possible.

## Strutting Ground Counts

The status of the sage grouse breeding population for 1998, as indicated by strutting ground counts, is shown in Table 1 and Figure 1 of this section. Results of this survey for 1998 compared to 1997 and the 1959-97 average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Number of grounds counted	137	-7	+50
Total male grouse counted	2,124	+29	+31
Average male grouse per ground	16	+41	-22
Percent change from previous year (comparable grounds)	--	--	--

Access for spring 1998 strutting ground counts was generally good in most regions of the state. The numbers of male grouse observed increased 29 percent statewide and average number of males per ground increased 41 percent over 1997.

## Brood Counts

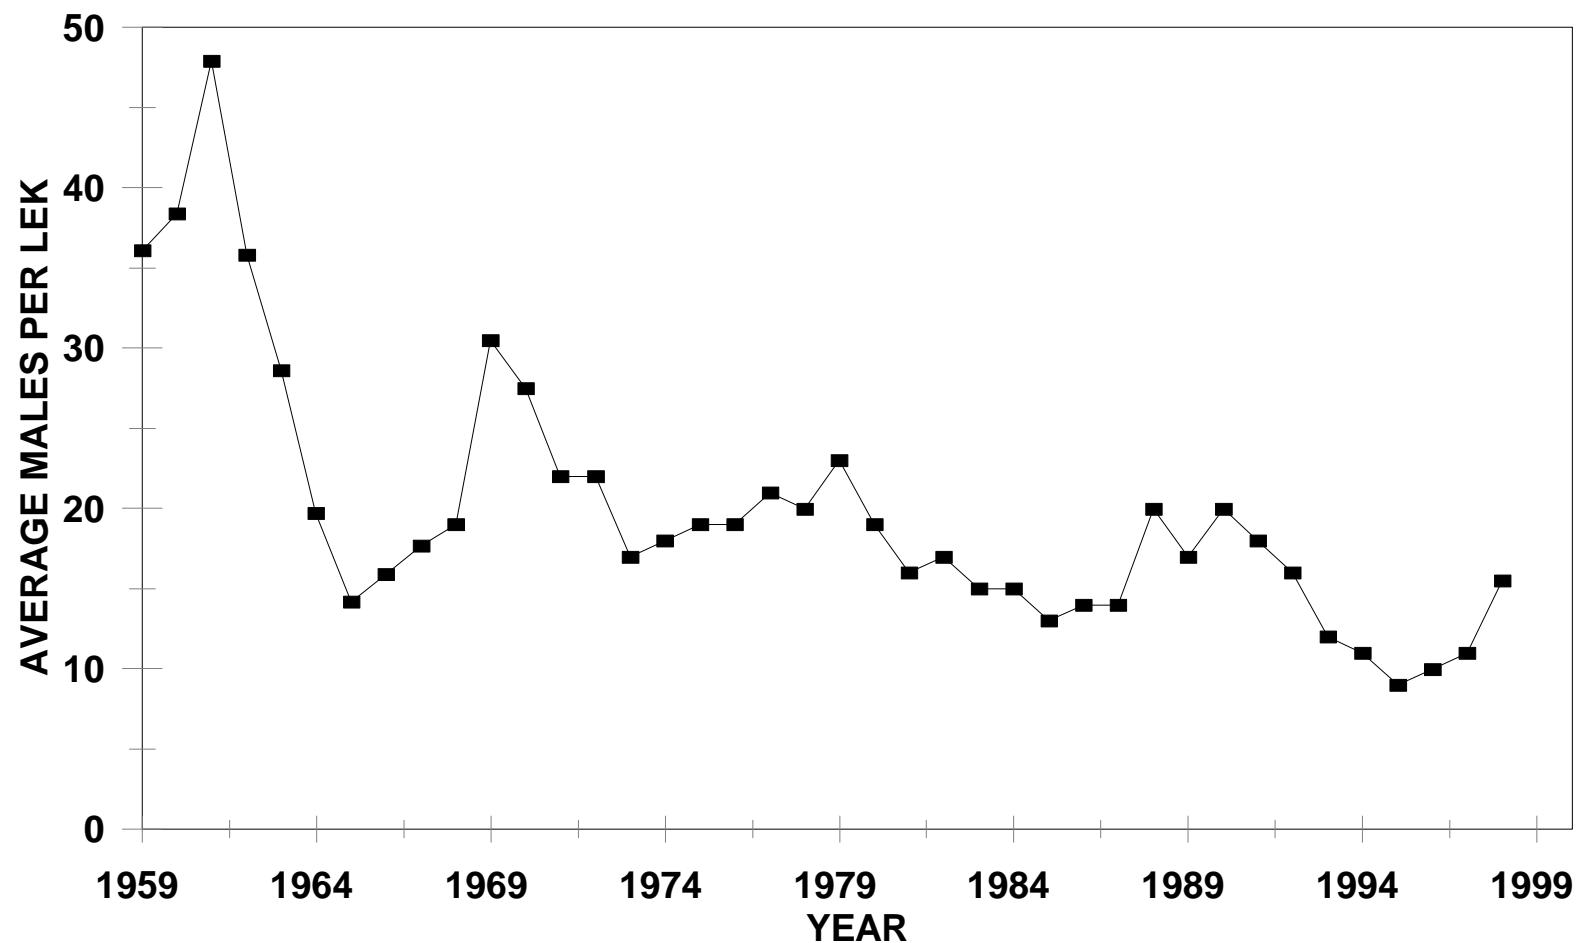

Results of the summer inventory survey for 1998 are found in Table 2. Long-term trends of young per adult ratios, mean brood size and sage grouse observed per 100 hours are shown in Tables 3-5. Indices for 1998 are compared to 1997 and the previous 10-year (1988-97) average as follows:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Total sage grouse counted	709	-27	+8
Young per 100 adults	264	+60	+62
Mean brood size	4.51	+2	+3
Sage grouse observed per 100 hours	921	+165	+211
Total hours effort	77	-73	-66

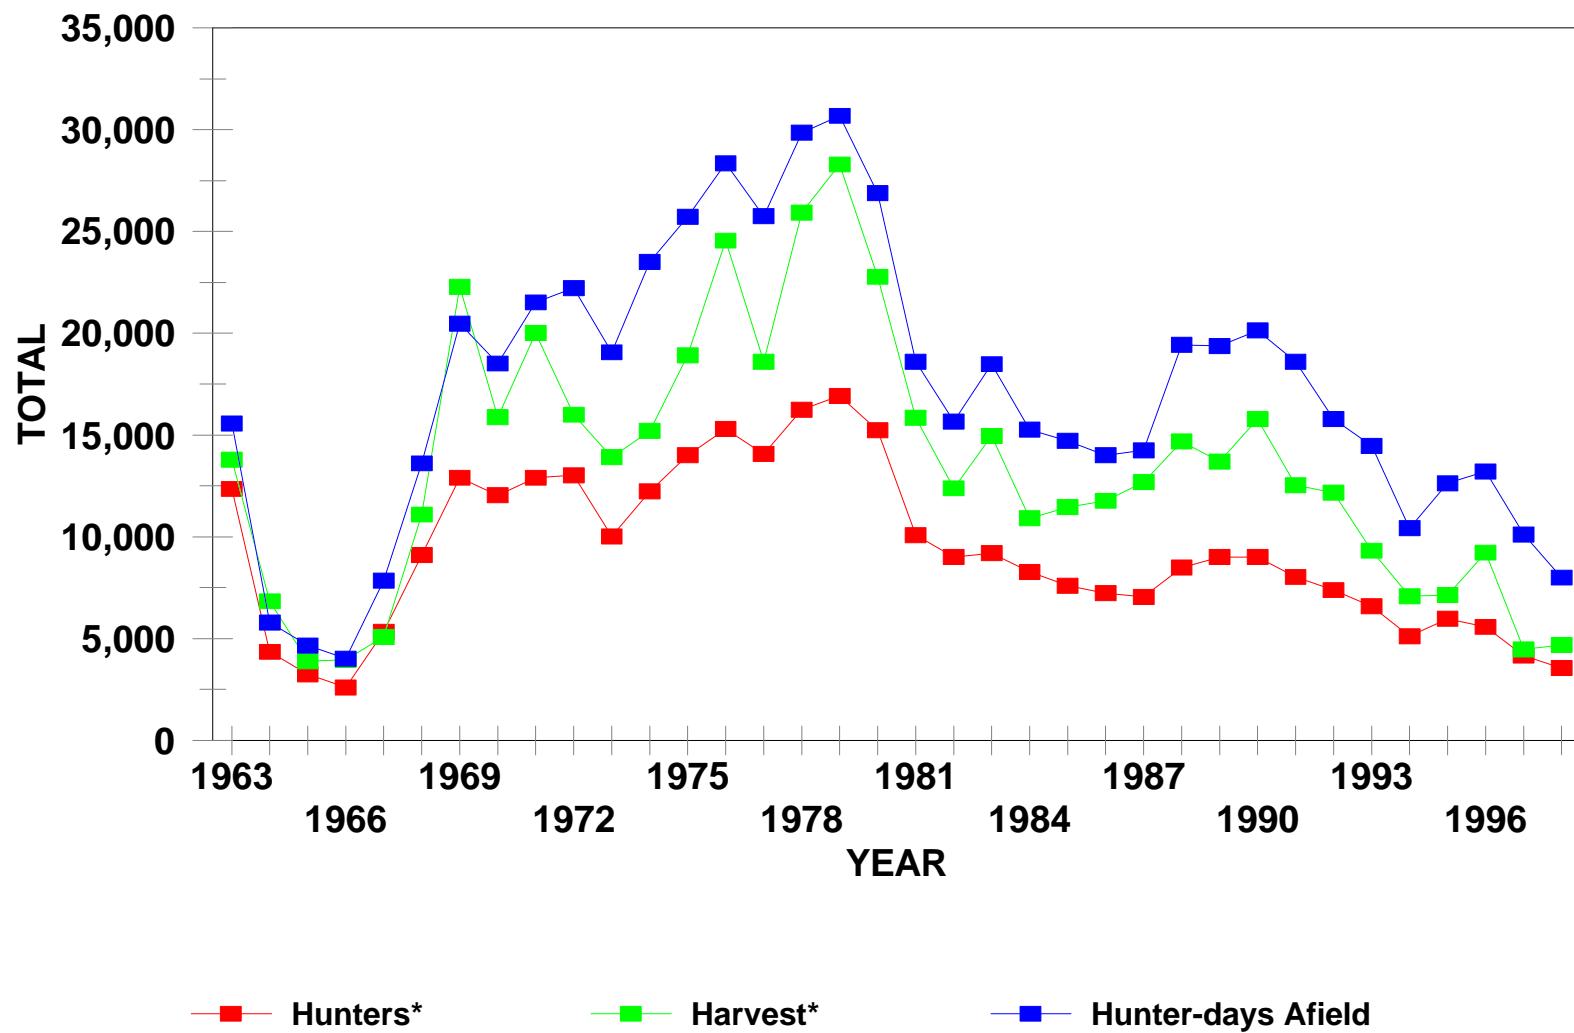

The effort devoted to sage grouse brood counts was 66 percent below average, and the total number of grouse counted was 8 percent above average.

Total sage grouse counted decreased 27 percent in 1998, while production of young per 100 adults increased 60 percent. The average brood size was 3 percent above the 10-year average.

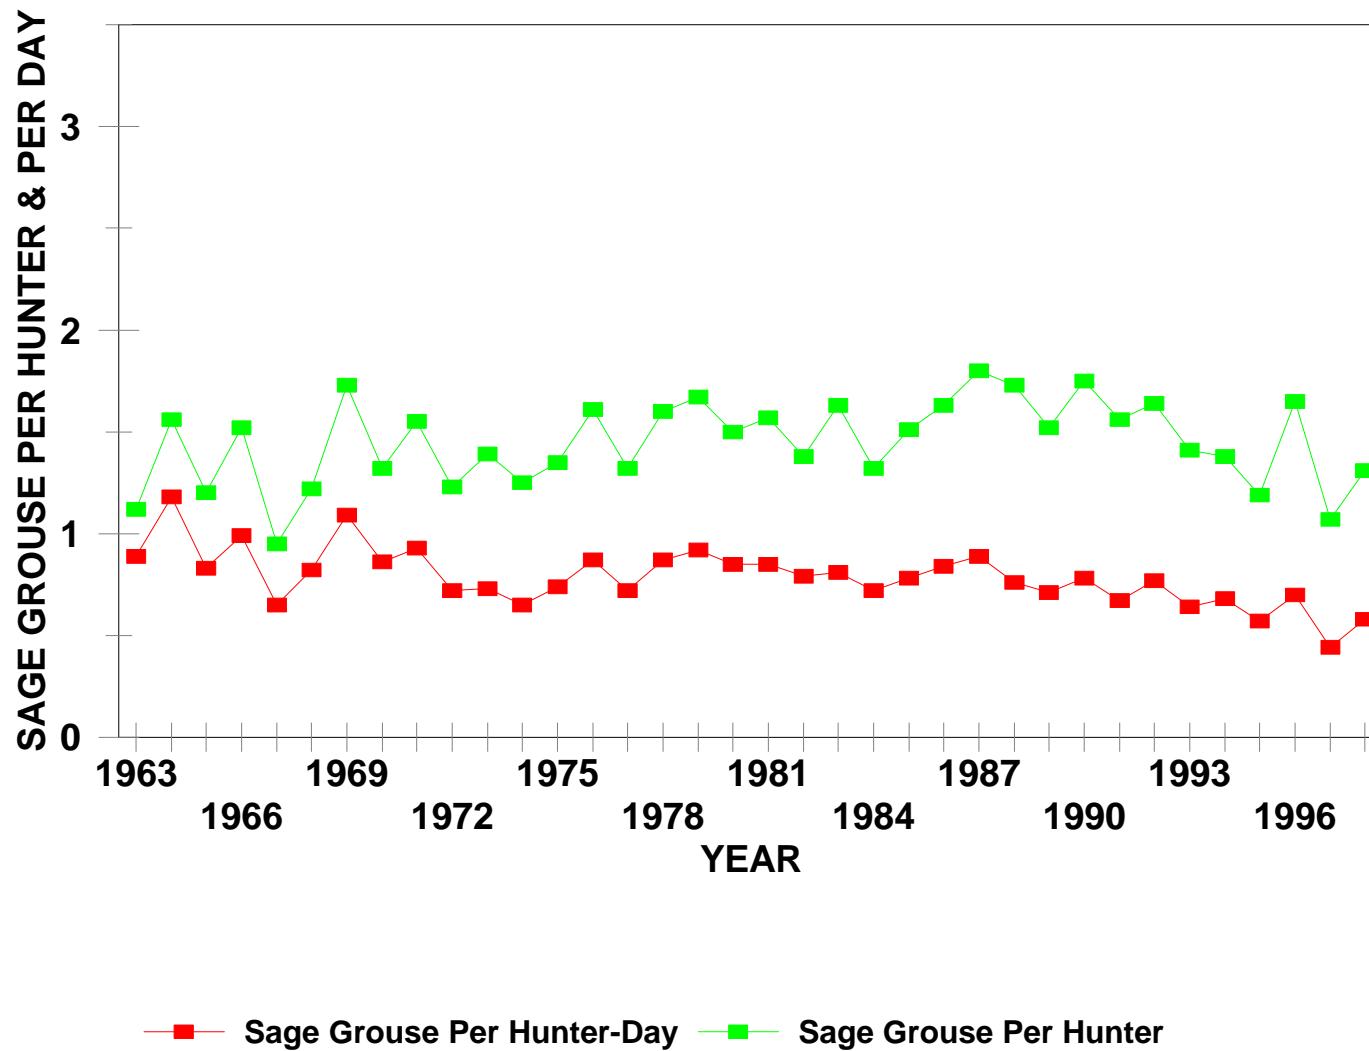

**Figure 1. Statewide trends of average sage grouse males per lek, 1959-98**

**Figure 2. Statewide trends of sage grouse harvest statistics, 1963-98.**

**Figure 3. Statewide trends of sage grouse hunter success rates, 1963-98.**

# Harvest

## Hunter Questionnaire

Results of the 1998 hunter questionnaire are shown in Table 6. Long-term trends of sage grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 7-9 and total statewide harvest statistics in Table 10. The results of the 1998 hunting season compared to 1997 and the previous 48-year average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Sage grouse hunters	3,559	-15	-51
Sage grouse harvested	4,676	+4	-57
Hunter-days afield	8,003	-21	-39
Sage grouse per hunter-day	0.58	+32	-5
Sage grouse per hunter	1.31	+22	-27

Sage grouse per hunter-day success rate increased 32 percent in 1998. Total statewide harvest increased 4 percent, and there was a 15 percent decrease in total sage grouse hunters.

Long-term sage grouse harvest trends are shown in Figures 2 and 3.

## Field Bag Checks

A summary of field bag check data for 1998 is shown in Table 11. Hunter success trends determined via this method are shown in Table 12. Results of the 1998 survey compared to 1997 and the 10-year (1988-97) average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Total hunters checked	156	-32	-70
Total hours hunted	572	-38	-79
Sage grouse per hunter (complete hunts)	0.71	+122	-12
Sage grouse bagged per 100 hours	19	+138	+8
Average hours per hunter-day (complete hunts)	3.67	-8	-23
Hours hunted per grouse bagged (complete hunts)	5.15	-59	-26

Hunter success rates from field bag checks showed increased success on the opening weekend of 1998. Sage grouse bagged per 100 hours increased 138 percent. Average hours per hunter-day decreased 8 percent from 1997. Average hours per grouse bagged decreased 59 percent.

## Sex and Age Composition of the Harvest

A summary of the sex and age composition of harvested sage grouse in 1998 is found in Table 13 and the trend from 1994-98 in Table 14.

Following are data derived from wing surveys in 1998 compared to 1997 and the 10-year (1988-97) average:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Sample size	427	+154	-40
Percent males	43	+10	+12
Percent females	57	-7	-7
Young per 100 adults	164	-45	+14
Young per 100 hens (adult)	235	-44	+27
Percent successfully nesting females			
Adults	59		
Yearlings	64		
All	61		

Analysis of wings collected at checking stations during the 1998 season indicates that statewide production was down 44 percent compared to 1997, but was 27 percent above the 10-year average.

(1951-97)	7,235	10,863	13,069	0.61	1.79

\* The number of sage grouse hunters and consequently harvest was limited by permits available from 1951 through 1962.

\*\* Estimated.

\*\*\* Totals and indices based on indiscrete data.

### **Forest Grouse**

### **Blue Grouse**

CLARK BRONSON

Brood count data for forest grouse provided small sample sizes, but is collected opportunistically. No meaningful information could be derived for ruffed grouse. Total blue grouse and blue grouse observed per 100 hours increased from 1997.

Total harvest increased 74 percent from 1997. Total hunters and days afield also increased.

As pheasant populations in Utah decline, interest in forest grouse hunting seems to be increasing.

### **Ruffed Grouse**

CLARK BRONSON

## Brood Counts

### Ruffed Grouse

Results of the annual random brood survey for 1998 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and ruffed grouse observed per 100 hours are found in Tables 2-4. A summary of effort expended on ruffed and blue grouse brood counts combined is shown in Table 9. Survey results for 1998 compared to 1997 and the previous 10-year average (1988-1997) follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Total ruffed grouse observed	--	--	--
Young per 100 adults	--	--	--
Mean brood size	--	--	--
Ruffed grouse observed per 100 hours	--	--	--
Total hours effort	--	--	--

No effort was expended to collect ruffed grouse brood count data in 1998. This data is collected opportunistically.

### Blue Grouse

Results of the annual random brood survey for 1998 are shown in Table 5 of this section. Long-term trends of young per adult ratios, mean brood size and blue grouse observed per 100 hours are found in Tables 6-8. Survey results for 1998 compared to 1997 and the 10-year average (1988-97) follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Total blue grouse observed	176	+66	-3
Young per 100 adults	232	-8	-8
Mean brood size	3.48	-9	-5
Blue grouse observed per 100 hours	11,733	+1670	+3767
Total hours effort (forest grouse)	1.5	-91	-99

The 1998 brood count surveys on blue grouse indicated that production decreased 8 percent from 1997 and was 8 percent below average. Efforts to collect blue grouse brood information decreased 91 percent in 1998. This data is collected opportunistically.

# Harvest

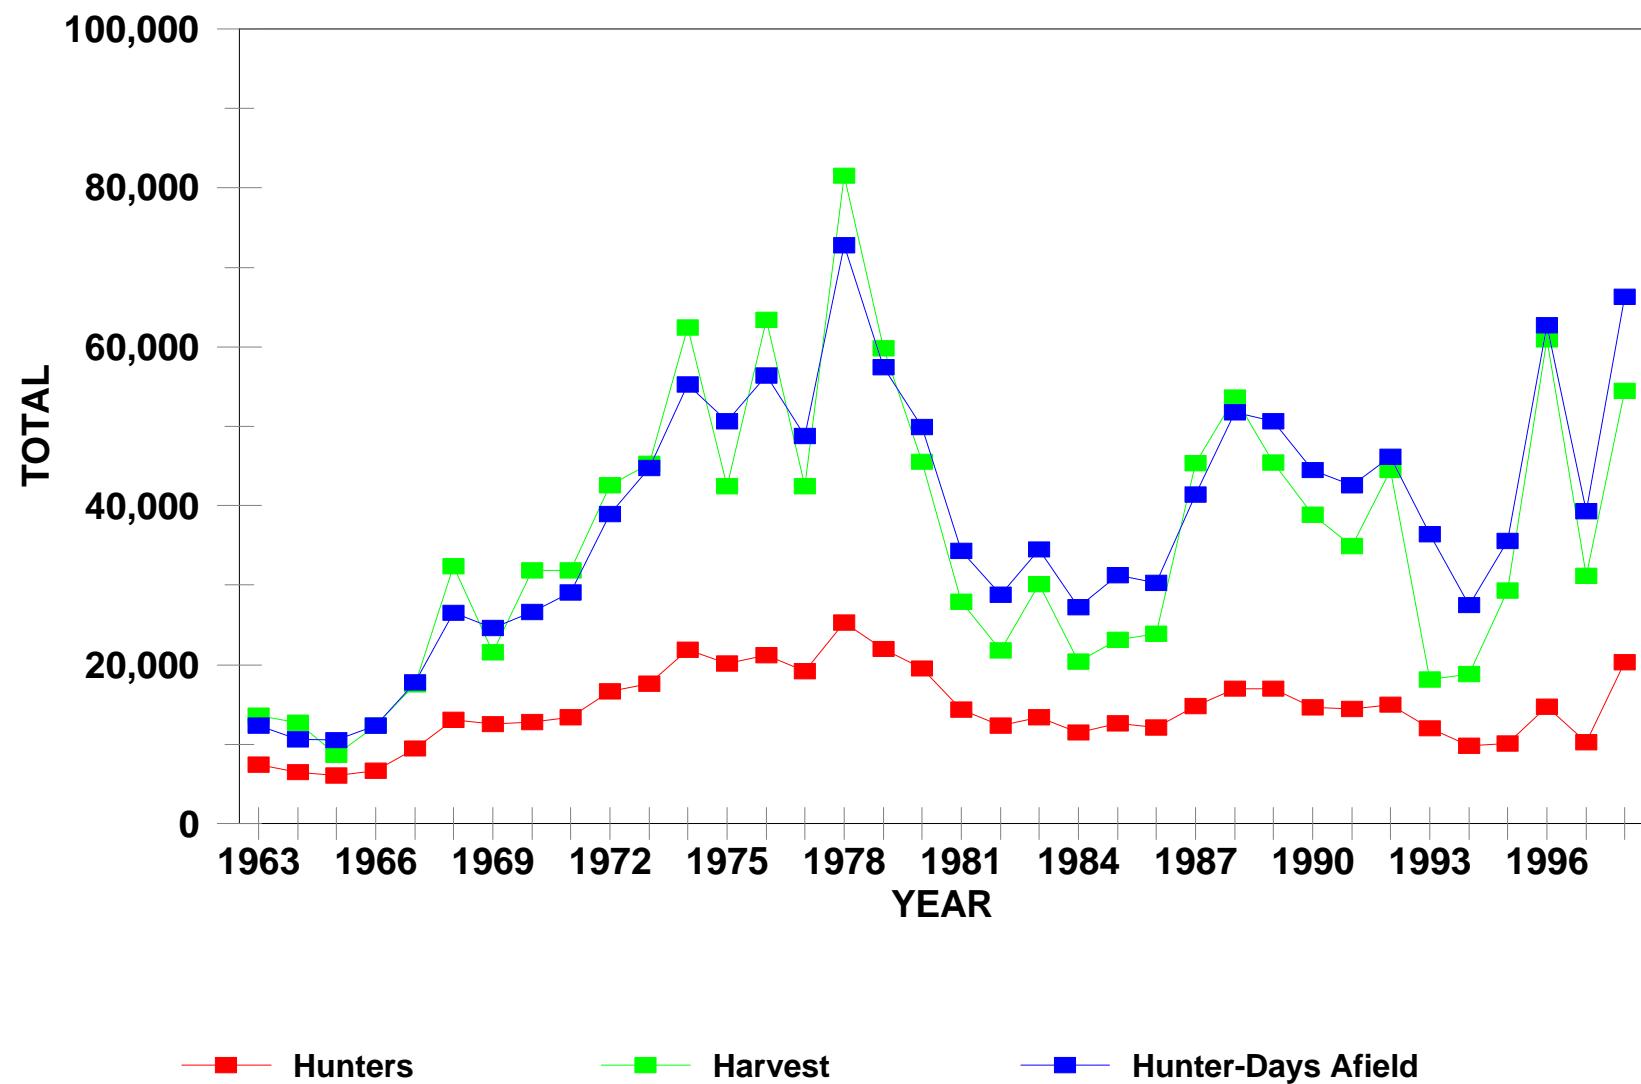

## Hunter Questionnaire

Results of the 1998 blue grouse, ruffed grouse and combined hunter questionnaire are shown in Table 10, 11 and 12 respectively. Long-term trends of forest grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 13-15 and total statewide harvest statistics in Table 16 and Figures 1 and 2. Forest grouse season length, bag limits and harvest statistics, 1963-98 are listed in Table 17. Harvest statistics for 1998 compared to 1997 and the 35-year average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Forest grouse hunters	20,310	+99	+43
Forest grouse harvested	54,439	+74	+54
Hunter-days afield	66,256	+69	+77
Forest grouse per hunter-day	0.82	+6	+99
Forest grouse per hunter	2.68	-12	+13
Percent ruffed grouse	23.12	-51	-41
Percent blue grouse	27.14	-48	-51
Percent unidentified	49.74	--	--

Total harvest increased 74 percent from 1997 and was 54 percent above average. Overall, hunter success (grouse per hunter-day) increased 6 percent in 1998, and remains 99 percent above average. The number of grouse harvested per hunter was 13 percent above average.

**Figure 1. Statewide trends of forest grouse harvest statistics, 1963-98.**

**Figure 2. Statewide trends of forest  
grouse hunter success rates, 1963-98.**

## Field Bag Checks

A summary of field bag check data for 1998 is shown in Table 18. Hunter success trends determined via this method are shown in Table 19.

Results of the 1998 survey compared to 1997 and the 10-year (1988-97) average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Total hunters checked	25	-89	-94
Total hours hunted	49	-88	-96
Forest grouse per hunter (complete hunts)	0.44	+63	-38
Forest grouse bagged per 100 hours	19	+27	-35
Average hours per hunter-day (complete hunts)	2.25	+9	-37
Hours hunted per grouse bagged (complete hunts)	5.14	-97	-96

Forest grouse per hunter increased 63 percent from 1997, but remained 38 percent below the long-term average.

## Sex and Age Composition of the Harvest

Sex and age composition of the harvest as determined from wings is shown in Tables 20 and 21.

Following are data derived from ruffed grouse wing surveys in 1998 compared to 1997 and the 10-year (1988-97) average:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Sample Size	111	+158	-27
Percent Males	--	--	--
Percent Females	--	--	--
Young per 100 adults	208	+23	-6
Young per 100 hens (adult)	--	--	--

Following are data derived from blue grouse wing surveys in 1998 compared to 1997 and the 10-year (1988-97) average:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Sample Size	146	+248	+145
Percent Males	46	-23	-26
Percent Females	54	+35	+20
Young per 100 adults	147	-60	+4
Young per 100 hens (adult)	264	-76	-21

\*\* From 1950 to 1963 a grouse stamp was required to hunt any grouse. In 1964, the entire state was opened to hunting without a stamp.

## **Quail**

CLARK BRONSON

### **California Quail**

Statewide harvest statistics, when compared to 1997, showed an increase in total harvest. Hunter success (birds per hunter-day) increased 23 percent and was 2 percent above average. Hunter-days afield increased 5 percent from 1997.

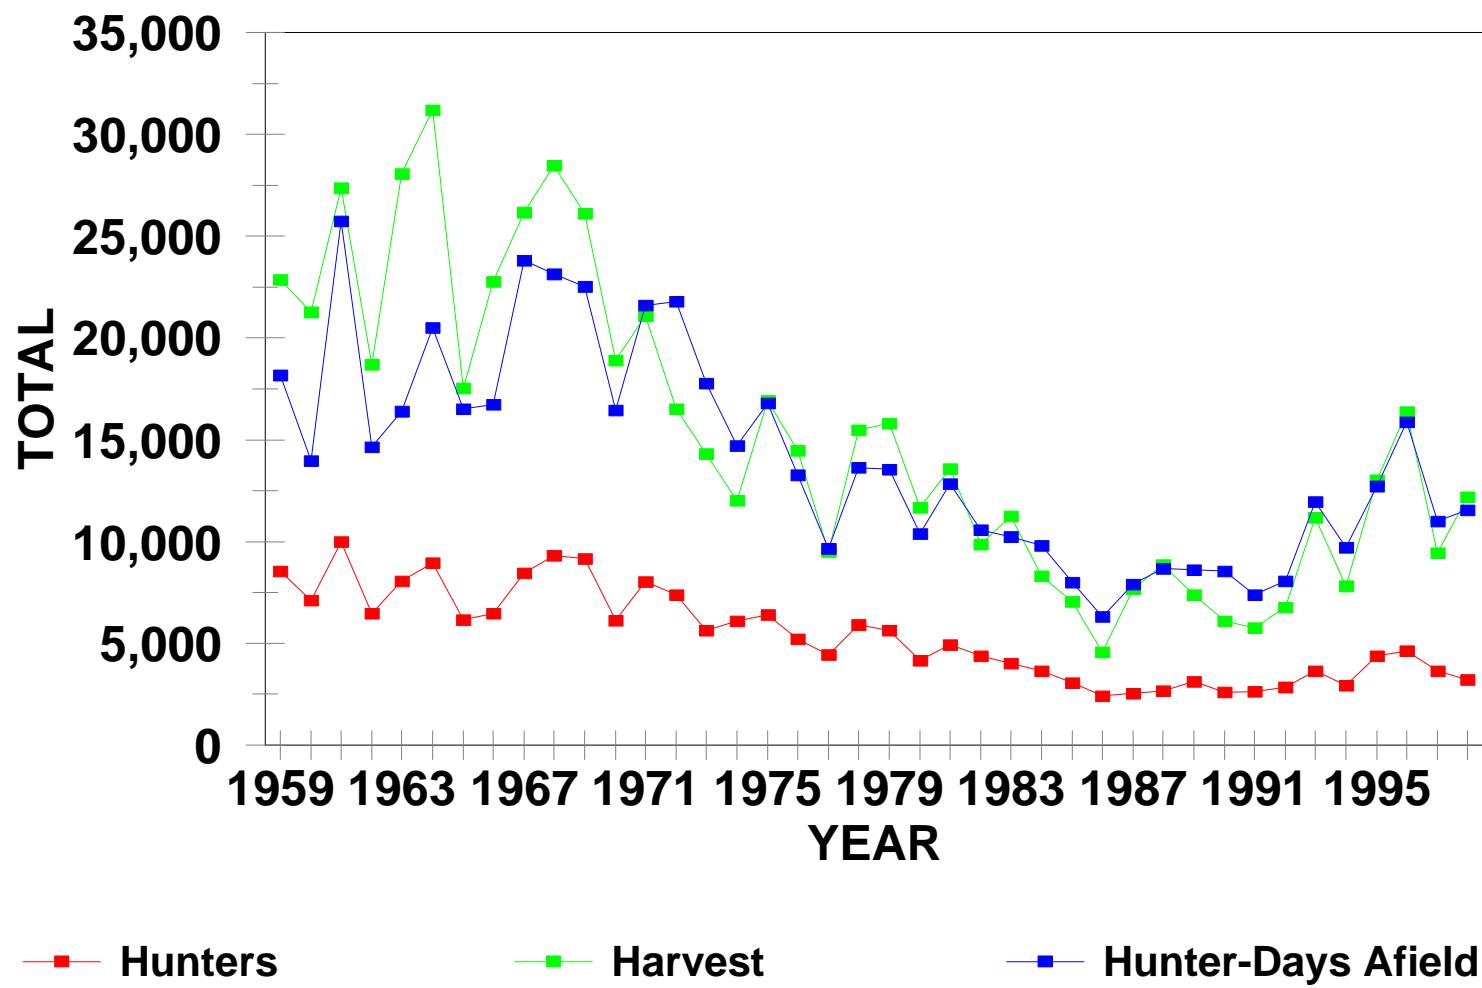

California quail are found primarily in urban areas of Utah. Hunter access to these birds is limited.

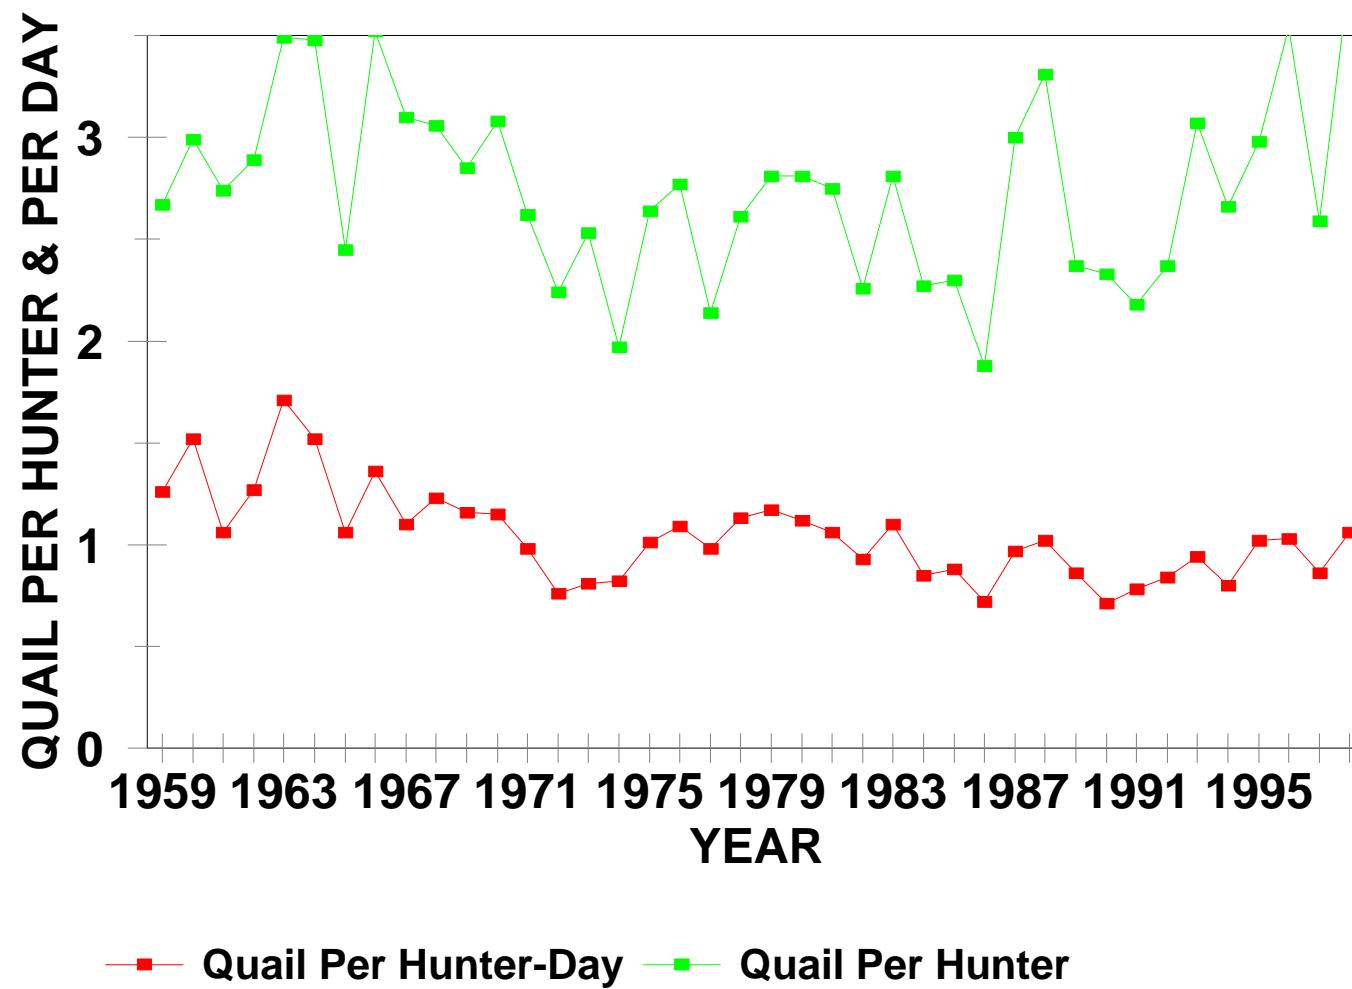

CLARK BRONSON

### **Gambel's Quail**

**Figure 1. Statewide trends of quail harvest statistics, 1959-98.**

**Figure 2. Statewide trends of quail  
hunter success rates, 1959-98.**

## Brood Counts

Results of the annual random brood counts for quail for 1998 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and quail observed per 100 hours are shown in Tables 2-4. Gambel's quail long period waterhole count trends are shown in Table 10. Survey results for 1998 compared to 1997 and the 10-year (1988-97) average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Total quail observed	285	+248	+30
Young per 100 adults	482	+66	+66
Mean brood size	10.26	+54	+44
Quail observed per 100 hours	8,143	+248	+308
Total hours effort	3.5	0	-75

Total quail observed increased 248 percent over 1997. Young per 100 adults increased 66 percent over 1997.

## Harvest

Results of the annual hunter questionnaire for 1998 are shown in Table 5. Long-term trends of quail bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8, and total statewide harvest statistics in Table 9.

Comparison of the 1998 season to 1997 and the 39-year average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Quail hunters	3,211	-12	-39
Quail harvested	12,213	+29	-15
Hunter-days afield	11,562	+5	-14
Quail per hunter-day	1.06	+23	+2
Quail per hunter	3.80	+47	+43

Quail hunters decreased 12 percent from 1997, and remain 39 percent below the long-term average. Quail harvest increased 29 percent from 1997.

Long-term quail harvest statistics are shown in Figures 1 and 2.

## Field Bag Checks

A summary of field bag check data for 1998 is shown in Table 11.

## Hungarian Partridge

The 1998 hunt data indicated slightly increased hunting pressure on Huns when compared to 1997. The number of Huns harvested increased 88 percent in 1998. Total hunters and days afield remain below the long-term average.

We expected continued improvement in Hungarian partridge populations in Box Elder County due to the large quantity of agricultural land set aside in the Conservation Reserve Program. We believe that increases in hunter success since 1985 reflect increased partridge populations as a direct result of CRP. Exceptions (declines) in 1988 and 1989 were probably due to drought. In 1993, the dramatic decrease in number of Huns harvested probably resulted because of poor over-winter survival during 1992-93.

## Brood Counts

Results of the annual random brood counts for 1998 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and Huns observed per 100 hours are shown in Tables 2-4. Results of the survey for 1998 compared to 1997 and the 10-year (1988-97) average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Total Huns observed	--	--	--
Young per 100 adults	--	--	--
Mean brood size	--	--	--
Huns observed per 100 hours	--	--	--
Total hours effort	--	--	--

No brood count data was collected in 1998. This data is only collected opportunistically.

## Harvest Hunter Questionnaire

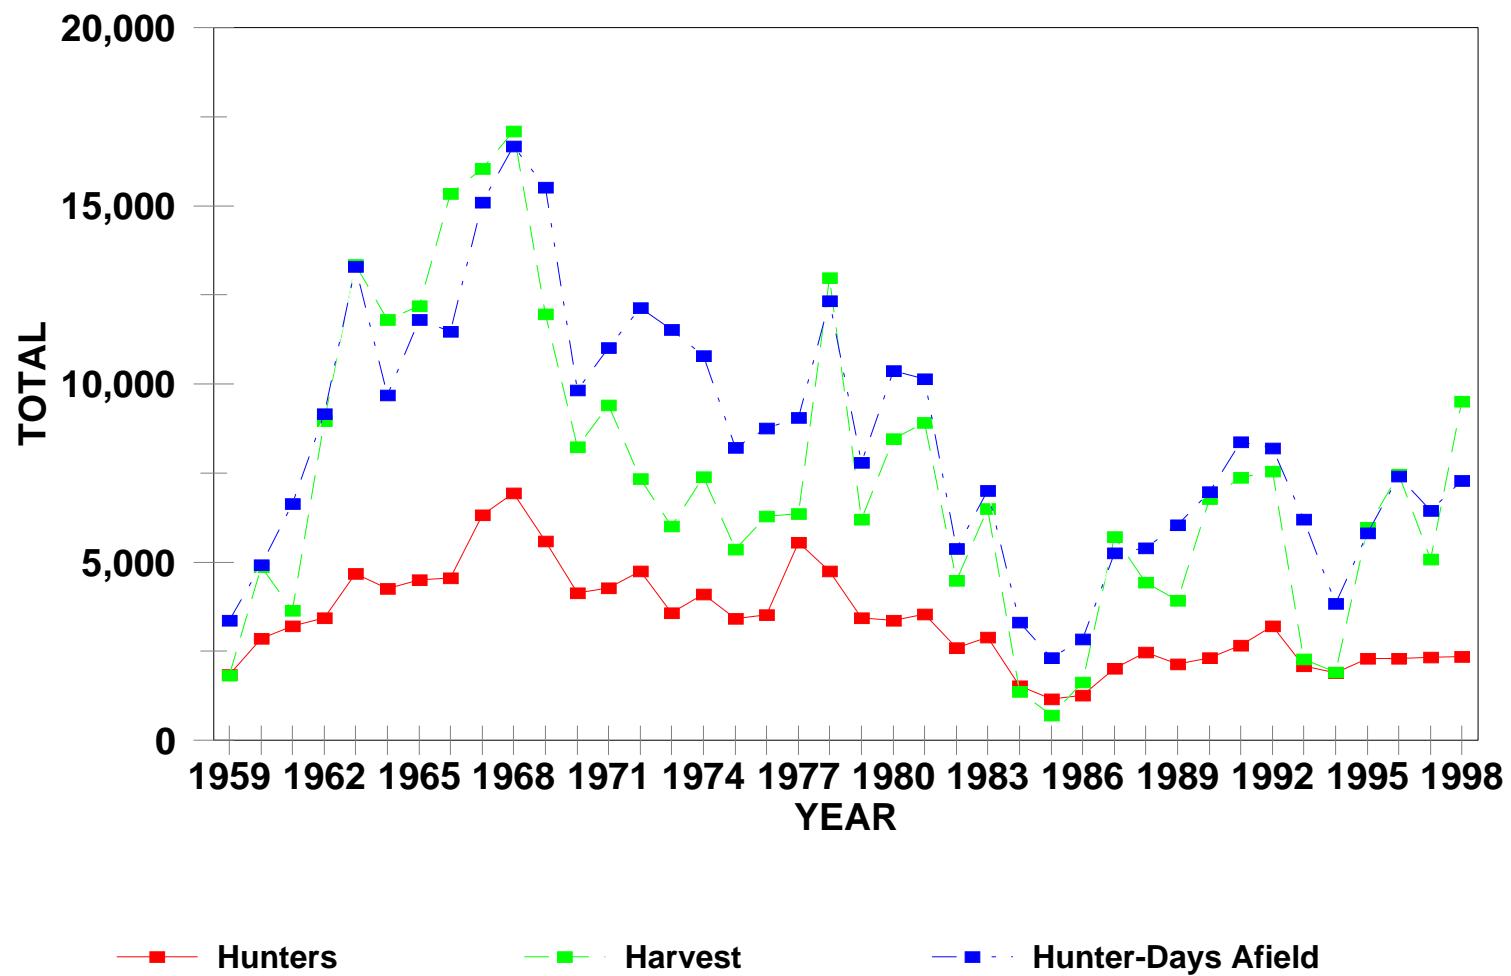

Results of the annual hunter questionnaire for 1998 are shown in Table 5. Long-term trends of Huns bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. The 1998 season compared to 1997 and the previous 39-year average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Hungarian partridge hunters	2,350	+1	-30
Hungarian partridge harvest	9,515	+88	+31
Hunter-days afield	7,281	+13	-14
Huns per hunter-day	1.31	+66	+61
Huns per hunter	4.05	+86	+97

Hungarian partridge hunters and hunting pressure increased in 1998. Overall success increased 86 percent from 1997. Harvest was 31 percent above the long-term average.

Long-term Hun harvest statistics are shown in Figures 1 and 2.

**Figure 1. Statewide trends of Hun harvest statistics, 1959-98.**

**Figure 2. Statewide trends of Hun  
hunter success rates, 1959-98.**

In 1994, the entire state went to limited entry turkey hunting for both the Merriam's and Rio Grande sub-species. Drawing odds for each of the 1998 hunts is shown in Table 6.

## Merriam's Turkeys

Merriam's turkey populations remain stable. Limited entry hunting was allowed on 4 units, during a total of 7 seasons. Three units were open for early and late seasons. A total of 358 permits were sold. A fall turkey hunting season was not held in Utah in 1998. A total of 95 Merriam's turkeys were harvested in 1998. Merriam's turkey hunters experienced a 31 percent success rate.

## Rio Grande Turkeys

Two hundred sixty-three permits were sold in 1998. A total of 161 Rio Grande turkeys were harvested in 1998 for a success rate of 63 percent.

## Conservation Permits

Beginning in 1997, Sealed-bid and Auction Turkey Permits were replaced by Conservation Permits. Under the new Conservation Permits Rule (R657-41), wildlife conservation organizations obtain permits, authorized by the Utah Wildlife Board, and use them in fund-raising activities to generate management funds for each species. Qualified wildlife conservation organizations typically keep 10 percent of funds generated for marketing, etc. Organizations, in some cases, can keep more than 10 percent of funds generated from permits if they propose habitat or management projects to benefit the species.

In 1998, the statewide turkey conservation permit was issued to the Utah Chapter National Wild Turkey Federation. The statewide turkey conservation permit allows the holder to hunt over an extended season (from the first date that any Utah turkey unit opens through the last date that any Utah turkey unit closes) on any open turkey unit in the state. In 1998, the statewide turkey conservation permit sold for \$900.00.

In 1998, fourteen area turkey conservation permits were issued to the Utah Chapter National Wild Turkey Federation and the Mule Deer Foundation. An area turkey conservation permit allows the holder to hunt over an extended season on one or a combination of open turkey units. In 1998, the fourteen area turkey conservation permits generated \$7,305.00.

Total turkey conservation permits funds generated in 1998 was \$8,205.00.

# Harvest

## Spring Merriam's Gobbler Season

Results of the 1998 spring season are shown in Table 1 of this section. The trend of these data since 1968 is shown in Table 2 and Figures 1 and 2. Statewide summary of fall hunt statistics is in Table 3. The 1998 spring season survey compared to 1997 and the previous 30-year average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Permits sold	358	-1	+29
Hunters afield	309	-9	+23
Turkeys harvested	95	+17	+170
Hunter-days afield	1,218	+1	+55
Percent hunter success	31	+29	+145
Turkeys bagged per hunter-day	0.08	+14	+77
Percent of hunters who observed turkeys	18	-79	-58

Beginning in 1994, a limited entry turkey hunting program was implemented in Utah. Total harvest increased from 81 in 1997 to 95 in 1998. Hunter success rates increased 29 percent from 1997 and were 145 percent above the long-term average.

## Spring Rio Grande Gobbler Season

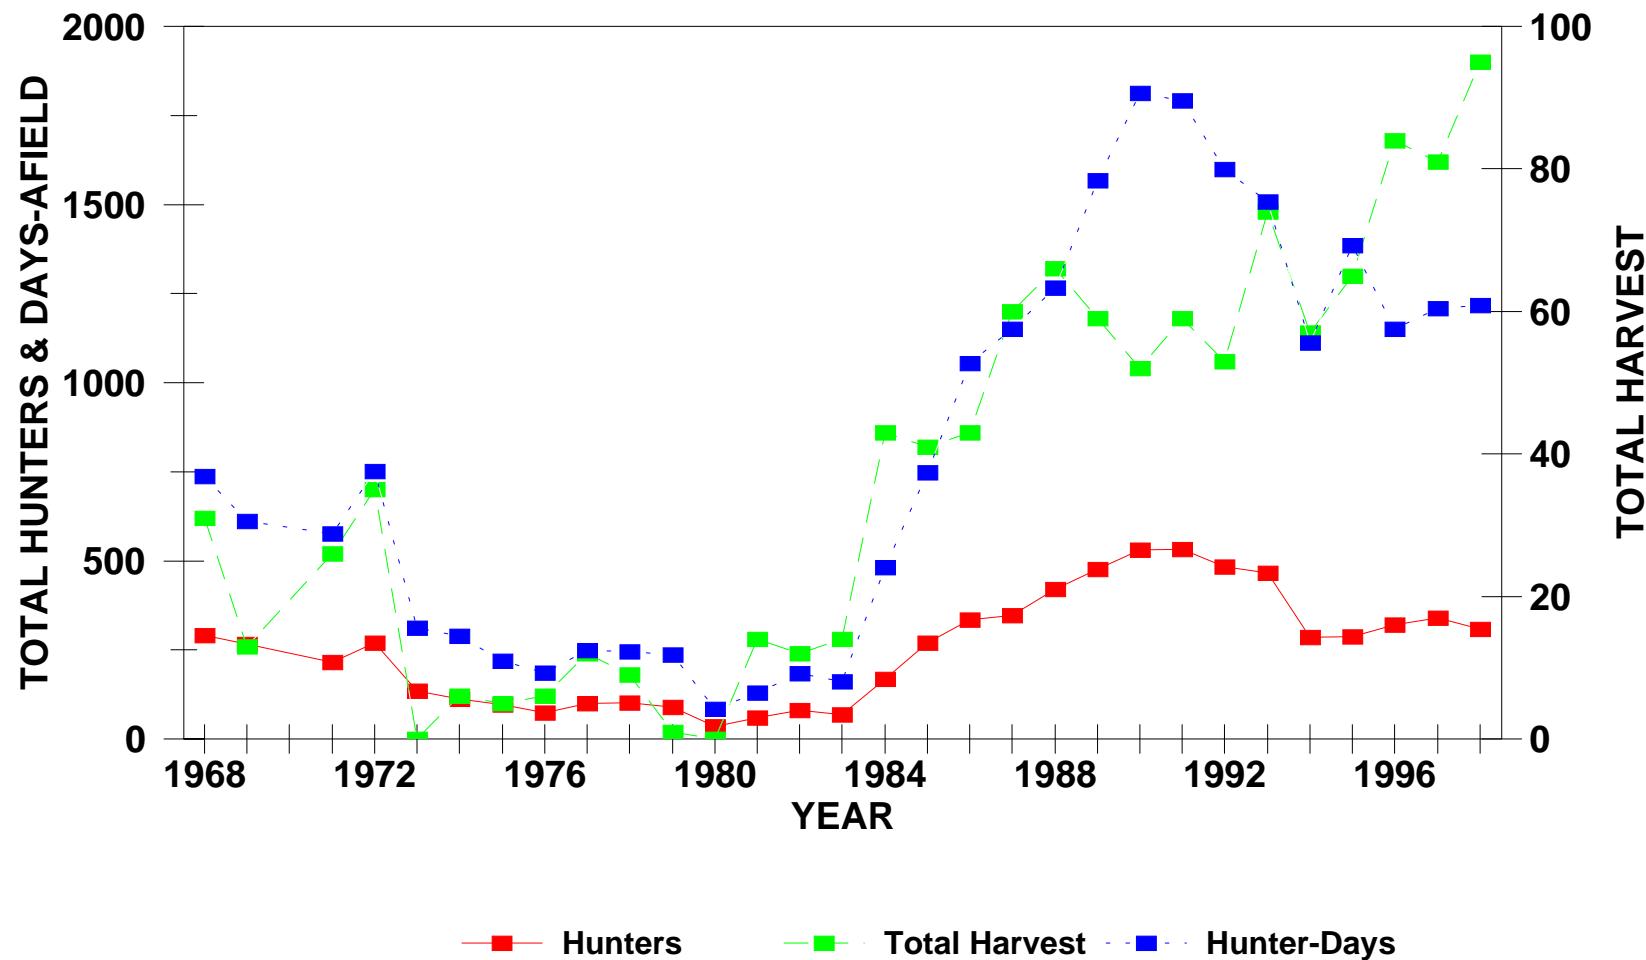

Results of the 1998 spring season are shown in Table 4 of this section. The trend of these data since 1991 is shown in Table 5. The 1998 spring season compared to 1997 and the previous 7-year average follows:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Permits sold	263	+10	+150
Hunters afield	254	+11	+153
Turkeys harvested	161	+27	+154
Hunter-days afield	919	0	+106
Percent hunter success	63	+15	-3
Turkeys bagged per hunter-day	0.18	+29	+16
Percent of hunters who observed turkeys	57	-30	-33

Two hundred fifty-four hunters averaged 3.62 days-afield each to harvest a total of 161 turkeys. Sixty three percent of the hunters afield harvested a bird.

As other Rio Grande populations continue to grow throughout the state, more hunting opportunities will be provided.

\*Some hunters hunted more than one area or failed to designate areas hunted. This accounts for the difference between totals given above and combined tables of separate units in Tables 5, 6 and 7.

\*\*During 1968, the Boulder Mountain and East Zion units had two-bird season limits and the LaSal Mountains a one-bird limit; from 1969 through 1972, all areas had a two-bird limit. Hunter success was based on the number of successful hunters rather than total turkeys bagged.

\*\*\* No fall season.

## Sharp-tailed Grouse

The Columbian sharp-tailed grouse is one of four species of grouse native to Utah. Sharptails were formerly abundant in the valley and foothill areas of northern and central Utah. Sharp-tailed grouse habitats were the most attractive areas for agricultural development and grazing. As a result, sharptail habitat was directly converted to farmland or was seriously impacted by heavy grazing.

Annual lek count survey data from 1979-98 is found in Table 1.

There was no legal harvest of sharp-tailed grouse from 1980 through 1997.

In 1998, as a result of intensive lek location surveys conducted in 1997 and 1998, a conservative, limited entry hunting season was offered. The hunt occurred in eastern Box Elder County in Northern Utah. The hunt strategy was designed to allow for the take of no more than 10-15 percent of the total fall population of sharptails. A total of 663 two-bird permits were offered through a drawing and first come-first served after the drawing. A total of 378 permits were sold. Two hundred and thirty-five hunters went afield and harvested 172 sharptails. Harvest statistics for 1998 are found in Table 3.

In Box Elder County, habitat associated with existing populations of sharp-tailed grouse has been relatively unchanged since 1983 except that about 100,000 acres in Box Elder County have been entered into the Conservation Reserve Program (CRP). This may be benefitting sharp-tailed grouse populations by providing undisturbed nesting and brood-rearing cover.

Sharp-tailed grouse brood count information for Box Elder County in 1998 is shown in Table 2. However, no specific brood count data was collected.

**Table 1.** Lek counts of Columbian Sharp-tailed Grouse in Utah 1979-1998.

## White-tailed Ptarmigan

The white-tailed ptarmigan (*Lagopus leucurus*) was introduced into the Uinta Mountains of northeastern Utah in 1976 with the release of birds captured in Colorado. The initial transplant consisted of 22 paired birds released in June 1976. A second release of 35 mixed young and adults was accomplished in September of that same year.

Since introduction in 1976, ptarmigan have dispersed into available habitat from the west, 100 miles to the east in the Uinta Mountains.

## Breeding Territory and Brood Surveys

Surveys on the ptarmigan population continue, but only as time and manpower constraints allow. Two survey techniques are used. A breeding territory survey is conducted from mid- to late June. A brood survey is conducted from mid- to late August. Results of the last 10 years of survey data are found in Tables 1 and 2.

These surveys have not been conducted over the past several years due to the remoteness of ptarmigan habitat and other constraints on biologist's time.

## Harvest

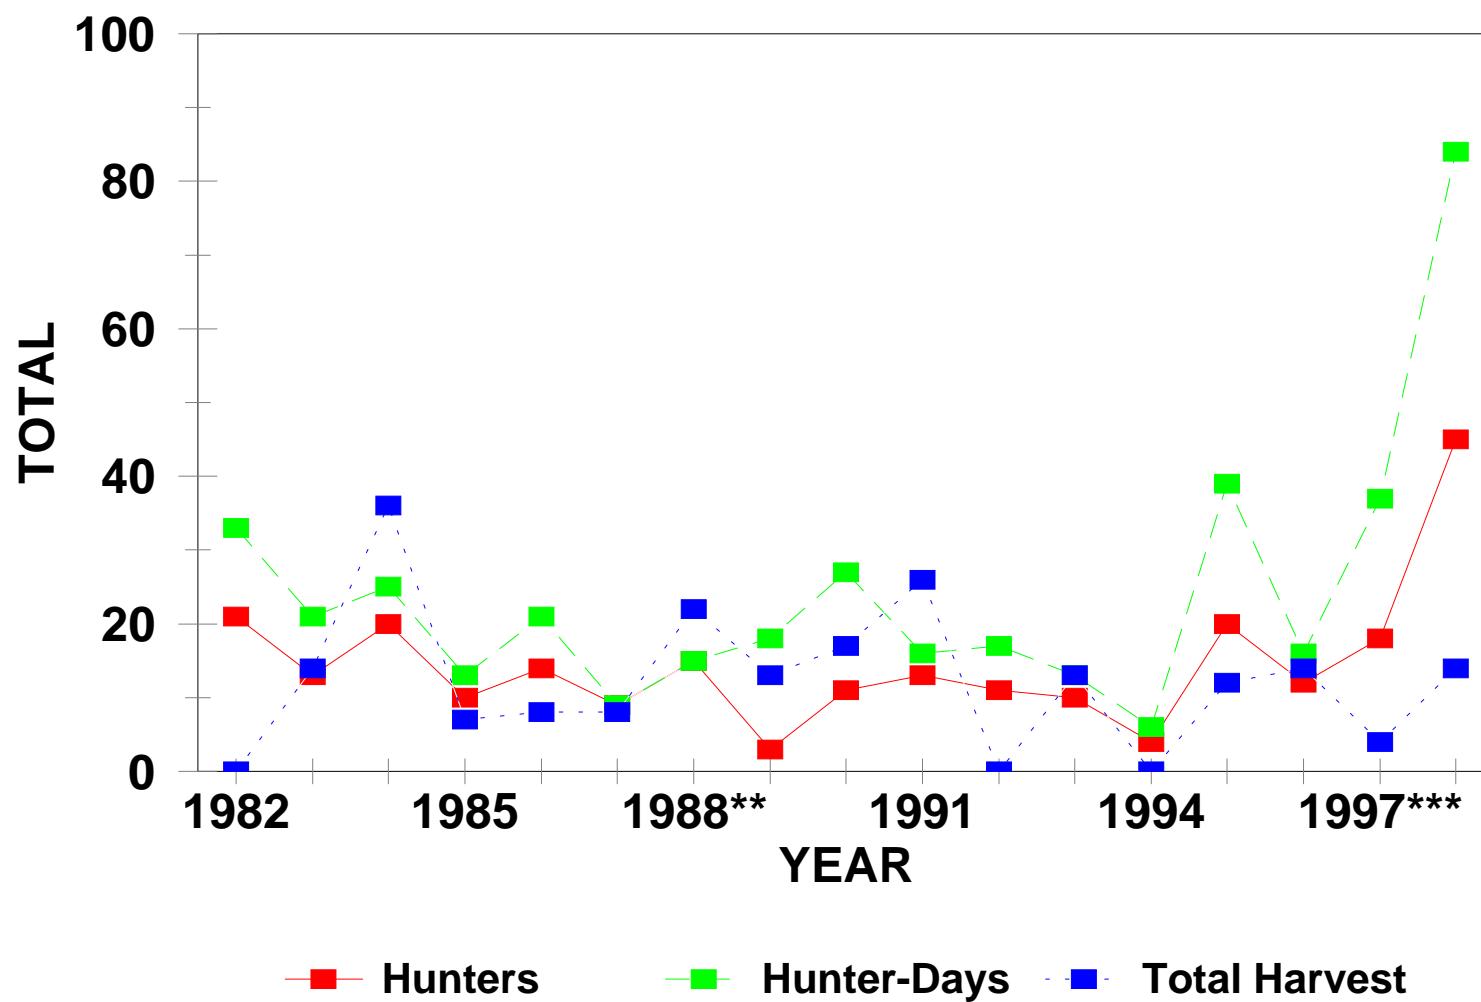

Seventy-five hunters obtained free permits to hunt ptarmigan in Utah in 1998 (Table 3). An estimated 45 hunters actually pursued ptarmigan and 14 birds were killed.

Many permits are obtained by sportsmen who think they might hunt during a fishing or big game hunting trip, but don't seriously plan on the ptarmigan hunt.

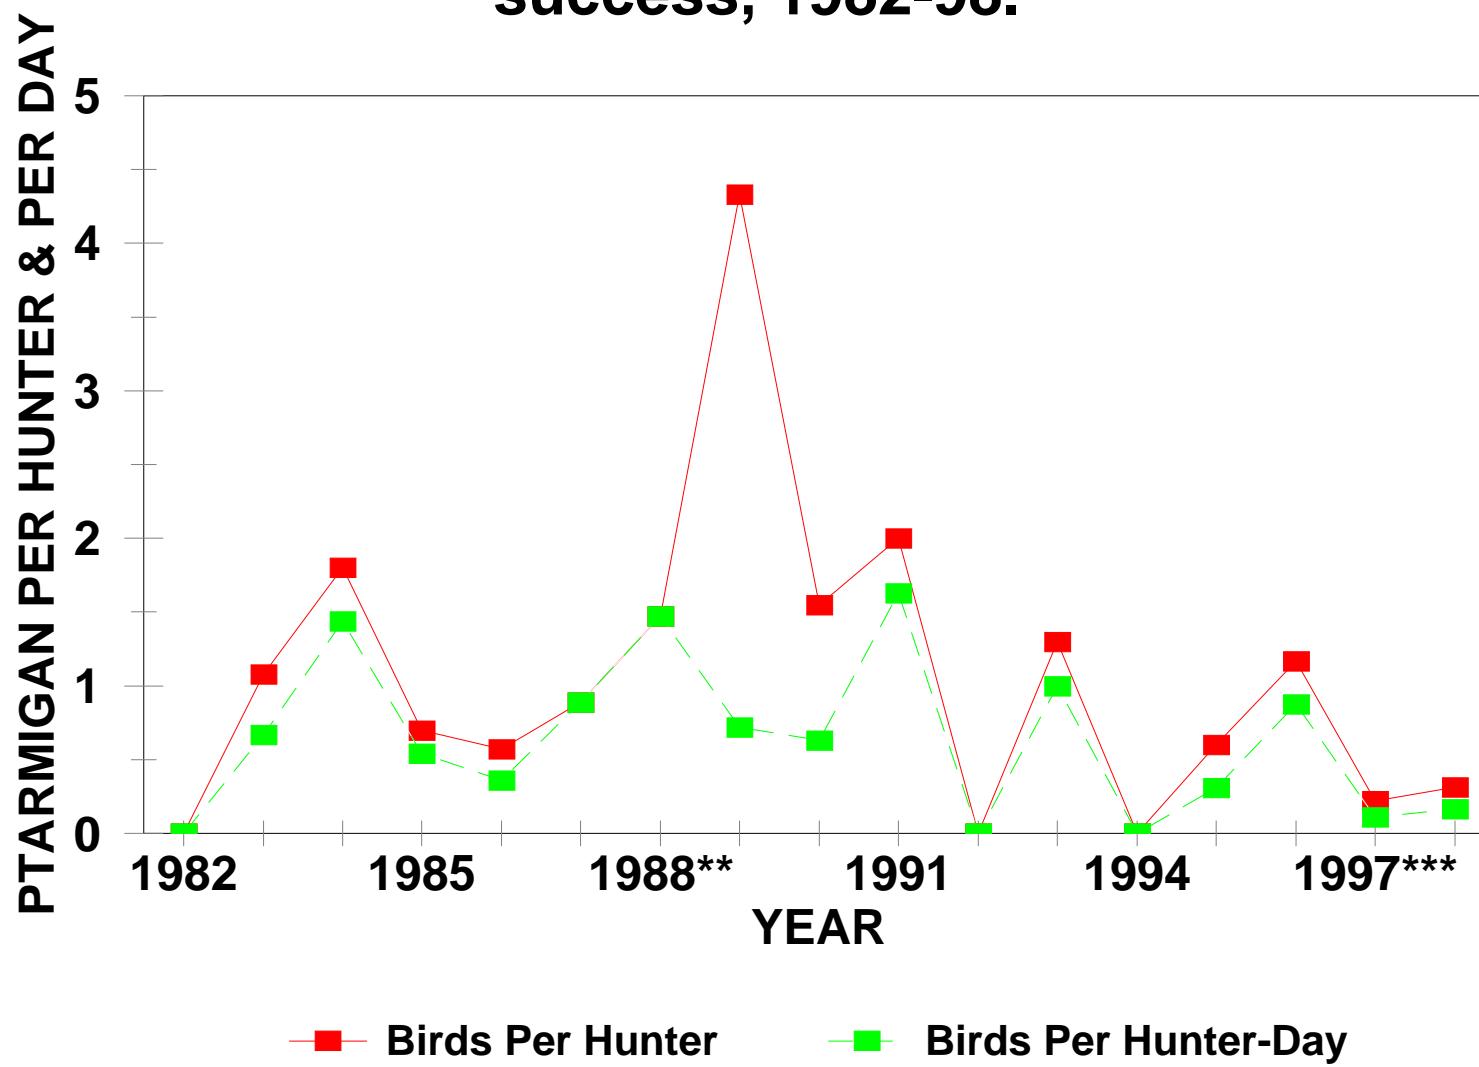

Results of the 1998 season are shown in Table 3 of this section. The trend of these data since 1982 is shown in Table 3 and Figures 1 and 2. The 1998 season compared to 1997 and the previous 16 year average follows:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Permits sold	75	+60	+143

## Rabbits and Hares

**Cottontail Rabbit**

Summer roadside counts indicated a slightly increased population density statewide, but reproduction was below 1997. Harvest statistics indicated increased hunter success, but is still 13 percent below average.

**Snowshoe Hare**

Hunter numbers decreased 43 percent from the previous year and remained below average. Total hares harvested decreased 56 percent from 1997.

# COTTONTAIL RABBIT

## Roadside Counts

Results of the annual roadside counts for 1998 are shown in Table 1 and Figure 1. The long-term trend of cottontails observed per mile and young per 100 adults is shown in Tables 2 and 3. Indices for 1998 compared to 1997 and the 10-year (1988-97) average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Total miles driven	1401	+169	+100
Total cottontails counted	351	+176	+40
Cottontails observed per mile	0.25	+4	-24
Young observed per 100 adults	88	-10	+15

Production data from roadside counts indicated an increase in the statewide cottontail population. Cottontails observed per mile increased 4 percent from 1997. The cottontail young per 100 adults index decreased 10 percent from 1997, but was 15 percent above the long-term average.

## Harvest

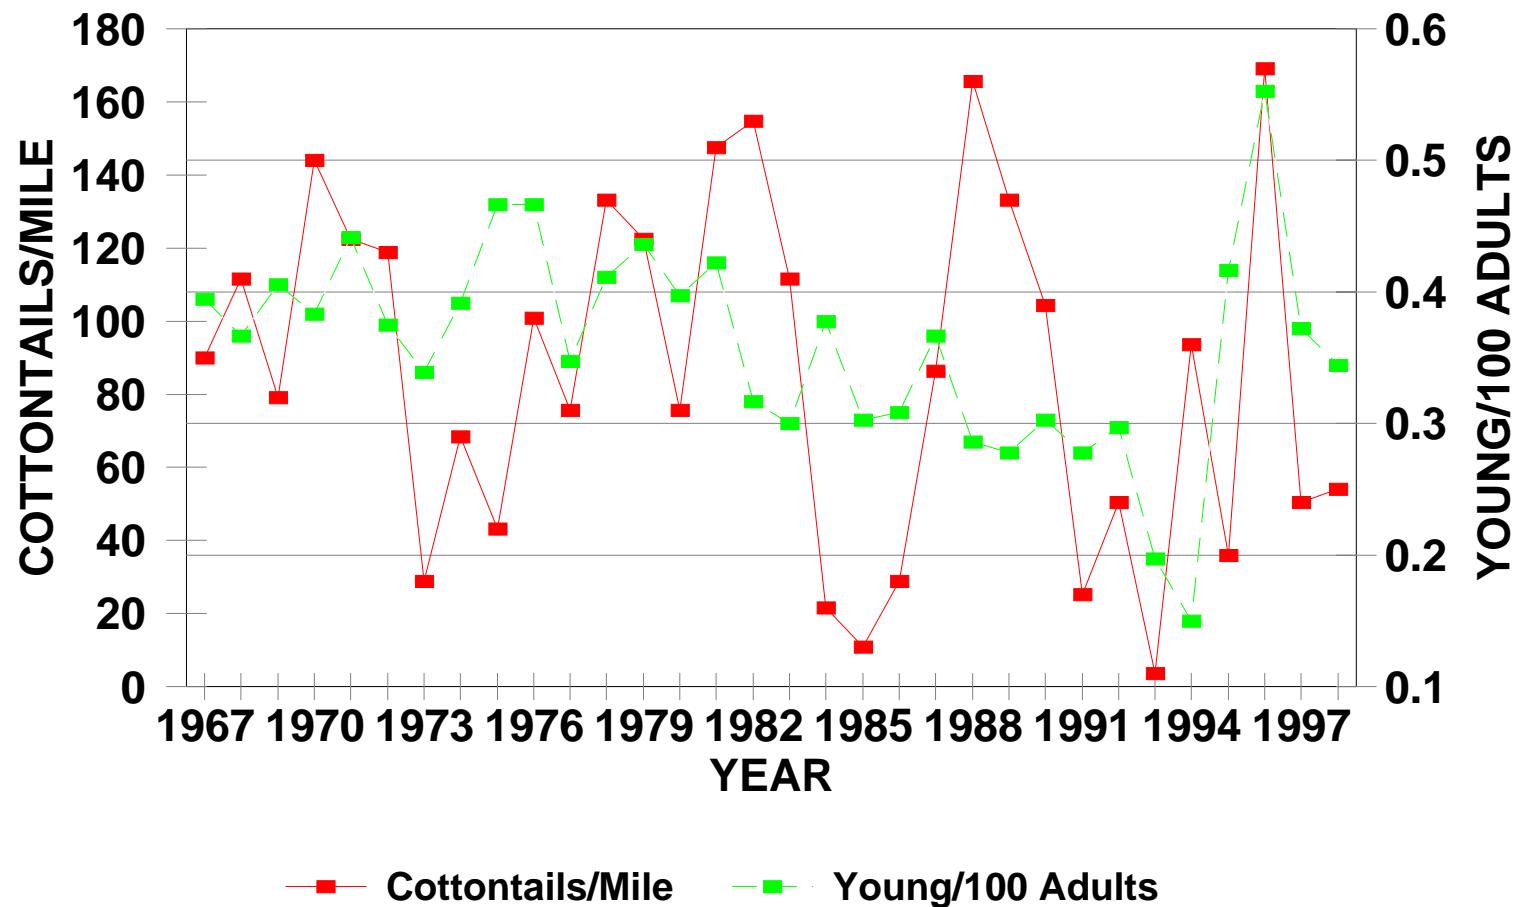

### Hunter Questionnaire

Results of the 1998 hunter questionnaire are found in Table 4. Trends of cottontails bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 5-7. Trends of statewide harvest statistics are found in Table 8 and Figures 2 and 3. Results of the 1998 season compared to 1997 and the previous 31-year average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Cottontail hunters	10,585	-14	-54
Cottontail harvest	57,137	-6	-60
Hunter-days afield	45,947	-13	-51
Cottontails per hunter-day	1.24	+7	-13
Cottontails per hunter	5.40	+8	-8

Total hunters decreased 14 percent from 1997. Total harvest decreased 6 percent. Total harvest was 60 percent below average. Hunter success was 13 percent below average.

**Figure 1. Cottontail rabbit population  
indices trends, 1967-98.**

**Figure 2. Statewide trends of c/t  
rabbit harvest statistics, 1967-98.**

**Figure 3. Statewide trends of c/t  
rabbit hunter success rates, 1967-98.**

# SNOWSHOE HARE

## Harvest

Results of the 1998 hunter questionnaire are found in Table 11. Trends of snowshoe hares bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) are found in Tables 12-14. Trend in statewide harvest statistics by year are shown in Table 15 and Figures 1 and 2. The 1998 season compared to 1997 and the previous 23-year average follow:

	<u>1998</u>	<u>Percent change from 1997</u>	<u>Percent change from Average</u>
Snowshoe hare hunters	1,093	-43	-75
Snowshoe hares harvested	1,070	-56	-88
Hunter-days afield	3,536	-54	-73
Snowshoes per hunter-day	0.30	-6	-49
Snowshoes per hunter	0.98	-23	-46

Significant misidentification of white-tailed jackrabbits as snowshoe hares was anticipated prior to mailing the harvest questionnaire following the first season in 1975. This proved to be the case as a significant harvest of snowshoe hares was reported for counties outside the known range of the species. It was assumed that the problem was statewide, not just confined to those counties. Several attempts were made in the 1970s to reduce misidentification through pictures and descriptions in leaflets and questionnaires.

Beginning in 1988, harvest questionnaires, and in 1989 the Upland Game Proclamation had drawings and descriptions of the various rabbits and hares in an attempt to reduce misidentification. We believe this has been successful.

Results of the 1998 harvest questionnaire indicates a 6 percent decrease in hunter success compared to 1997. Success was 49 percent below the long-term average.

## APPENDIX A

### WEATHER CONDITIONS

Weather information used in this report (Tables 1 & 2 and Figures 1 & 2) is from the office of the Utah State Climatologist and N.O.A.A. Climatological Data Periodical.

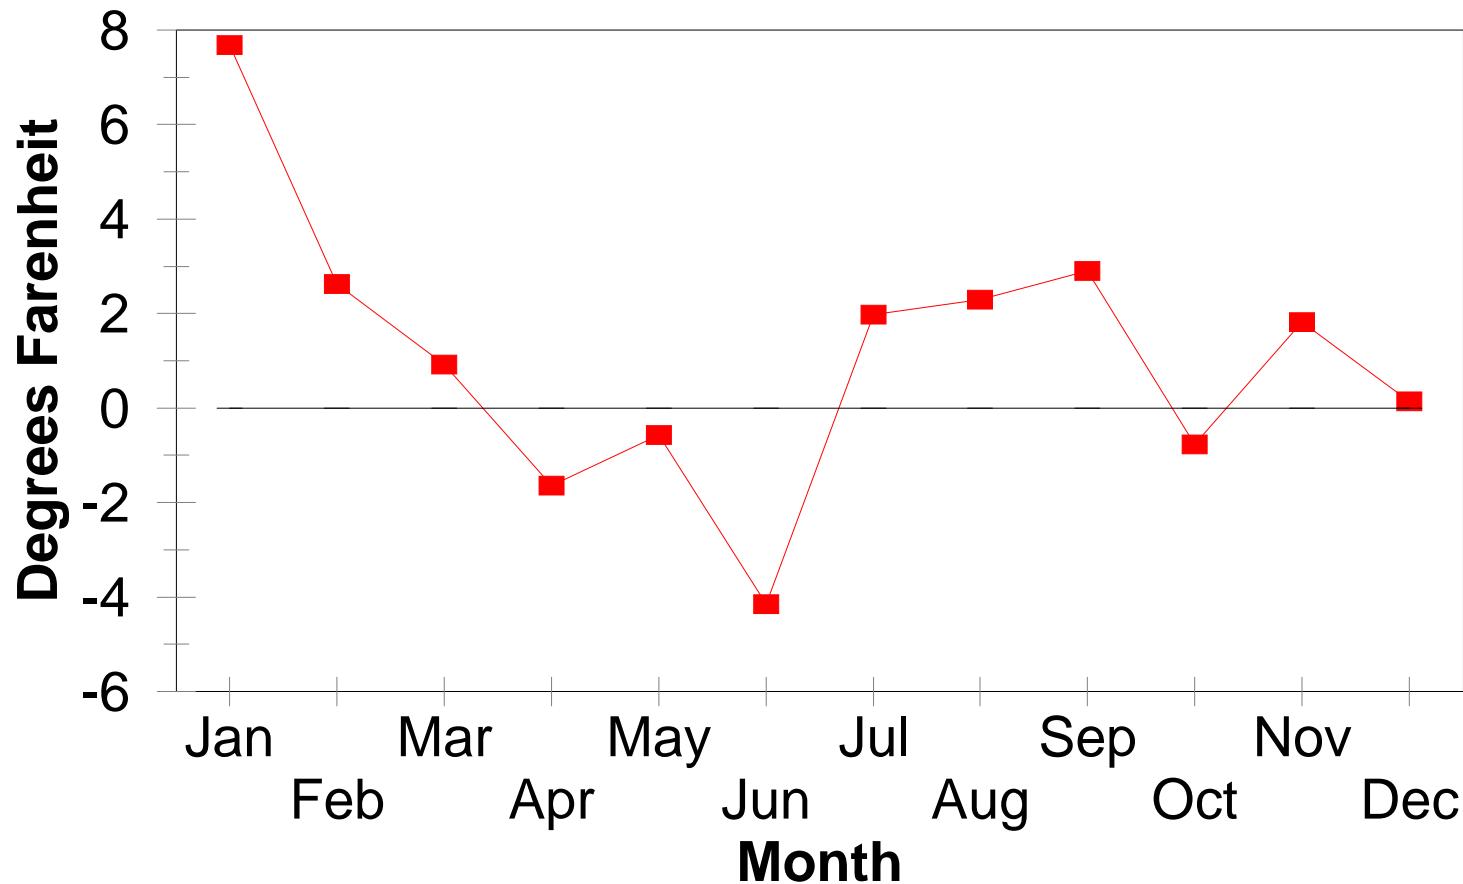

The 1997-98 winter weather was fairly mild in terms of temperature. During November, January-March temperatures statewide were above normal. Below average precipitation fell in October through December 1997. Above average precipitation occurred January through March.

In the spring of 1998, temperatures were below normal April through June. Precipitation was above normal April through July.

**Table 1. Comparison of 1998 monthly average temperatures (F) to the normal for each weather division and statewide.**

## APPENDIX B

### LICENSE SALES

Small game and Combination license sales by type and cost are listed in Table 1. The number of licenses sold for all types, except juvenile resident small game license, increased slightly in 1998.

The proportion of Utah's population hunting small game is declining (Table 2). In the early 1970s about 9 percent of Utah's population was hunting small game. In 1998, only 2.9 percent of Utah's population hunted small game.

Table 3 identifies revenue generated to the Utah Division of Wildlife Resources from small game license sales. Small game program budgets run about half the revenue generated, with the other half going to support services such as law enforcement, administration, accounting, and public services.

**Table 1. Statewide small game license sales information, 1954-98.**

Year	Adult Res.		Juv. Res.		Non Res.		Combination License	
	Small Game Issued	Cost	Small Game Issued	Cost	Small Game Issued	Cost	Small Game Issued	Cost
1954	12,990	\$3.50	5,170	\$2.00	561	\$15.00	79,574	\$6.00

1 Value does not include cougar, bear, limited entry and conservation wild turkey permits, habitat authorization and cooperative wildlife management unit fees or commercial hunting area licenses.

It does not include NRSG revenue--this is assumed to be primarily non-resident bear and cougar hunters.

2 Combination license values are based on the assumption that all waterfowl hunters purchased only combination licenses.

They may fish and hunt big game but they do not hunt any other small game. Therefore, duck stamp sales are subtracted from combination license sales when projecting revenue generated. The proportion of the combination license fee attributed to small game equals the resident small game license fee divided by the resident fishing license fee, plus the resident small game license fee or \$12.67 for 1997.

3 Total Federal duck stamps sold does not include those sold during the second quarter, April-June, because persons purchasing stamps during this quarter tend not to be hunters.

4 Half of the juvenile small game license sales were attributed to waterfowl hunters. Federal duck stamps are not required of juveniles less than 16 years of age.

## APPENDIX C

### Surveys

Regional and statewide summary of effort expended on upland game summer surveys, 1972-98 is found in Table 1.

Generally hours spent and miles driven on upland game surveys in Utah have declined dramatically since 1972. This is the result of competing uses of time for biologists and conservation officers. In addition, the restriction to a 40 hour work week by the Federal Fair Labor and Standards Act has further eroded survey effort. When effort and results have reached a lower critical sample size, surveys have not been conducted or little effort expended.

Table 1. Regional and statewide summary of effort expended on upland game summer inventory, 1972-98.
