"Finding out how many there are left is the least of the purposes of game census.

Measuring the response of game populations to changes - deliberate or accidental - in their environment is the big purpose.

Continuous census is the yardstick of success or failure in conservation."

Aldo Leopold 1932

ANNUAL PERFORMANCE REPORT

State: UTAH

Grant Number: W-16-RD

Segment: 3

Grant Title: Statewide Upland Game Management Surveys and Inventories

Grant Agreement Period: Oct. 1, 1998 thru Sept. 30, 1999

Abstract: This report identifies progress and accomplishments of Segment No. 3 objectives, 1998-99. Results of annual population surveys and inventories conducted during the segment W-16-RD-2 and harvest surveys conducted under W-16-RD-3 along with summaries of long-term trends of population indices derived and harvest estimates will be included in the Utah Upland Game Annual Report 1998. Data obtained in 1998 will be compared to 1997 and long-term averages.

The Federal Aid Annual Performance Report for W-16-RD-2 will be included in the Utah Upland Game Annual Report 1998, rather than this Annual Performance Report because of the annual reporting scheme initiated under W-65-R and because of the way population surveys and inventories and harvest data are collected.

Annual population surveys and inventories are collected during one segment and harvest surveys are conducted during the subsequent segment. The Utah Upland Game Annual Report is an attempt to summarize population survey and inventory data and harvest estimates for the same calendar year.

This reporting scheme may seem awkward, especially when one looks at a Utah Upland Game Annual Report and sees a copy of a Federal Aid Annual Performance Report included for a segment that ended before harvest survey data was actually collected.

Because this reporting scheme is somewhat confusing, but makes the most sense from a biological perspective to report population survey and inventory information for the same calendar year as harvest, it is hoped that the above explanation clarifies any confusion. Further, it is recommended that the reporting scheme remain the same.

The 1998 Utah Upland Game Annual Report (includes survey and inventory data from W-16-RD-2 and harvest data from W-16-RD-3) will be published in February 2000 and the 1999 Utah Upland Game Annual Report (includes survey and inventory data from W-16-RD-3 and harvest data from W-16-RD-4) will be published in July 2000.

I. OBJECTIVES OF GRANT PROPOSAL:

1. To annually monitor and evaluate 16 upland game species harvest and populations in Utah using appropriate surveys and inventories--on-going objective.
2. To administer Utah's upland game programs and to manage 16 upland game species based on population data obtained through Objective 1--on-going objective.
3. In conjunction with the Utah State University Extension Fisheries and Wildlife Specialist, compile, develop and publish a handbook pertaining to field identification, basic biology and ecology and sexing and aging techniques for Utah upland game.

Progress Statement and Summary of Work Completed During The Segment For Each Objective:

1. To annually monitor and evaluate 16 upland game species harvest and populations in Utah using appropriate surveys and inventories.

ANNUAL PERFORMANCE REPORT

UTAH W-16-RD STATEWIDE UPLAND GAME MANAGEMENT SURVEYS AND INVENTORIES

Ongoing Objective. Annual inventory procedures for ring-necked pheasants included winter sex ratio counts and summer roadside counts. The winter sex ratio counts were conducted from December 15, 1998 through February 10, 1999, as snow cover conditions allowed. Indices derived include hen-cock ratios and pheasants observed per 100 hours. Annual summer roadside counts (three or more per route) were conducted from July 22-August 22 on permanently established routes. Indices derived include pheasants per mile, young per mile, young per hen, mean brood and percent of hens with young. Pheasant crowing territory counts were selectively conducted by DWR's northern and central regions. Crowing territory counts are used by biologists to determine if habitat improvement projects are successful in increasing populations, and also as another index to local pheasant breeding populations.

Mourning dove breeding population trend was determined via the annual call count survey. This survey is part of a nationwide survey administered by the U. S. Fish and Wildlife Service. Call counts are conducted over 15 permanent, 20-mile routes. One count was made on each route between May 20-30, 1999.

Random brood counts were conducted on chukar and Hungarian partridge, forest grouse (ruffed and blue), sage grouse, sharp-tailed grouse, wild turkey and quail from June 15-August 22. Indices derived for each species include mean brood size, young per 100 adults and birds observed per 100 hours of effort.

Sage grouse strutting ground counts and sharp-tailed grouse dancing ground counts were conducted from March 15-May 15. Total cocks counted, average cocks per ground and percent change from 1998 for comparable grounds were determined on a county basis.

The Gambel's quail long period waterhole counts were completed in July and August. Limited valley quail random brood counts were made in several counties.

Cottontail rabbit roadside counts were conducted over pre-established routes between July 15 and August 22. Indices derived include rabbits per mile and young per 100 adults.

Harvest questionnaires were mailed to determine the harvest of upland game birds, cottontail rabbit, and snowshoe hare. A sample of eligible licensees from the current year's (1998) resident small game license file and combination license file was used. The modified computerized pull-apart mailer was again used to obtain harvest data. Separate questionnaires were mailed to all ptarmigan, band-tailed pigeon, sharp-tailed grouse and wild turkey permittees. Indices derived include total hunters, hunter-days, total harvest and hunter success per day, plus success for each season.

The upland game questionnaires were processed by the Utah Division of Wildlife Resources Public Services Section. Ptarmigan, band-tailed pigeon, sharp-tailed grouse and wild turkey questionnaires were analyzed separately by Utah Division of Wildlife Resources Wildlife Section personnel.

Upland game hunters were checked at checking stations, and random field checks were made during each hunting season. Indices derived include bag per hunter (per day), bag per 100 hours, average hours per hunter-day and average hours per bird bagged. Additional sex and age composition data were compiled for some species using wing samples collected at checking stations.

One ten mile helicopter transect was flown in Utah's west desert in August, 1999 to determine chukar population densities. Index derived was chukars per mile. This survey is flown only in Utah's west desert. Data derived from this survey has been very useful in compiling a fall hunt forecast for chukars.

One snowshoe hare track and pellet survey was conducted in Cache County. This is currently the only data being collected on Utah snowshoe hares outside of harvest data. This survey seems to be useful so far. We hope to collect this data into the future and to conduct a correlation analysis with harvest data to see if we might be able to predict harvest levels based on the track and pellet county survey.

ANNUAL PERFORMANCE REPORT**UTAH W-16-RD STATEWIDE UPLAND GAME MANAGEMENT SURVEYS AND INVENTORIES**

The winter flock count survey for wild turkey was fully implemented during the winter 1998-99. This technique seems to provide a useful index to Utah's turkey population. Data is used by local biologists to derive turkey harvest recommendations. We will continue to use this technique into the future to assess turkey populations.

New sage and sharp-tailed grouse leks were described and mapped during the segment as located.

Completion of the 4-Corners Band-tailed Pigeon Management Plan continues to wane. Several sections of the plan are being submitted by outside authors to the project leader who serves on and off as the plan's editor. Personnel changes in other states and higher priority projects in Utah and in the states of Arizona, Colorado and New Mexico have delayed the completion of the plan indefinitely. Further discussion on plan completion will occur at the March (2000) Pacific Flyway Regulations Meeting.

2. Ongoing Objective. To administer Utah's upland game programs and to manage 16 upland game species based on population data obtained through Objective 1.

Data collected in Objective 1 was used by DWR personnel to formulate harvest recommendations for 16 species of upland game in Utah. DWR personnel met in April, 1999 to formulate harvest recommendations for fall 1999 upland game seasons. DWR recommendations were presented at 5 Regional Advisory Councils and the public throughout the state in May. In June, recommendations were presented to the Utah Wildlife Board who made final decisions for recommendations to include in the 1999-2000 Utah Upland Game Proclamation.

In October and November, 1999, the project leader also presented DWR recommendations for wild turkey conservation permits and limited entry turkey hunting unit permits to 5 Regional Advisory Councils, the public and the Utah Wildlife Board. A separate Turkey Addendum to the Upland Game Proclamation was compiled, published and distributed. The purpose of the Turkey Addendum was to provide for the publishing of all Utah turkey hunting regulations, permit numbers and season dates in one document available at the time that turkey permit applications are submitted by hunters.

3. Objective To Be Completed Over 2 Years. In conjunction with the Utah State University Extension Fisheries and Wildlife Specialist, compile, develop and publish a handbook pertaining to field identification, basic biology and ecology and sexing and aging techniques for Utah upland game.

Objective 3 was not implemented in this segment. The Grant Agreement budget for Objectives 1 and 2 was underestimated and used up the funds intended for Objective 3. The apportionment for Wildlife Restoration Act funding was insufficient to increase the segment budget for Objective 3 and the task could not be implemented with only state funds which were also insufficient. We will continue to apply for sufficient funding, if available, otherwise this objective may not be accomplished in the Grant Period.

Location of Work Performed: Statewide.

Actual Cost:

INTRODUCTION

The objective of Utah's upland game management program is to provide recreational hunting opportunity for sportsmen within the limits of the annual harvestable surplus for each species. It is based on the knowledge that populations of upland game experience relatively high rates of annual turnover. High reproductive rates are naturally compensated for by high death rates, whether hunting is allowed or not. Annual surveys are conducted to measure the production, trend and harvest of each upland game population.

This is the twenty-ninth addition of this Annual Upland Game Report. It is an annual performance report of information compiled during inventory and harvest surveys conducted under Federal Aid Project W-16-RD. Information contained herein was collected and compiled by conservation officers, biologists, wildlife managers and the upland game management staff of the Utah Division of Wildlife Resources.

This report serves as a handbook of inventory and harvest data. It is designed primarily for the use of those concerned with the management of upland game. A separate section is devoted to each species of upland game in Utah. Data are presented primarily in tabular form with limited narrative comment. The first page of each section provides a brief summary of population status and trend as indicated by inventory and harvest data.

During 1999, a total of 55,553 Utah sportsmen spent 402,068 days afield in pursuit of various upland game species (Table 1). The harvest of upland game totaled 478,976 animals. The proportion of the total upland game hunters which pursued each species is shown in Table 2 and the percentage failing to bag at least one bird (from the general mail harvest questionnaire) of each species in Table 3.

The regulations for 1999 upland game hunting seasons are shown in Appendix D.

GENERAL HARVEST QUESTIONNAIRE

Harvest statistics were obtained from a random sample of licensed hunters by their response to a hunter harvest questionnaire. The combined upland game bird and rabbit-hare mail harvest questionnaire was again used.

A total of 14,630 upland game questionnaires, a 15.63 percent sample of Utah's potential upland game hunters, were mailed. Of the total, 656 (4.48%) questionnaires were undeliverable. Of the 13,974 questionnaires delivered, 5,426 (38.83%) useable upland game questionnaires were returned. Of those, 2,148 purchased a license but did not hunt upland game. By dividing the total of 93,607 eligible licensees by the usable returns (5,426), a projection factor of 17.251567 is derived.

The 1999 hunter questionnaire sample size was greater than 10 percent of the total hunter population, so a follow-up questionnaire was not sent to those who failed to return the first one. A high rate of return is desirable in order to obtain an adequate sample of harvest estimates in counties where hunting pressure and harvest are limited. Extremely small samples from these counties tend to over-estimate the harvest and thus bias the results. Although harvest, number of hunters and days-afield may be over-estimated where small samples are obtained, harvest per hunter-day should be relatively precise.

Table 1. Summary of harvest statistics from the general mail questionnaire for 1999.

Species	Hunters Afield	Total Harvest	Hunter-Days Afield	Bag Per Hunter-Day	Bag Per Hunter For Season
Pheasant	36,211	77,545	120,502	0.64	2.14
Mourning Dove	20,926	153,487	63,796	2.41	7.33
Band-Tailed Pigeon	49	156	103	0.66	2.10
Chukar Partridge	14,388	64,727	53,842	1.20	4.50
Sage Grouse	4,830	6,503	10,161	0.64	1.35

Total Hunters**	61,922	58,423	59,590	49,518	55,159	57,401	54,125	50,740	55,553									

*Although wild turkey, sharp-tailed grouse, band-tailed pigeon and white-tailed ptarmigan harvest was determined by separate questionnaires, it is assumed that these hunters are derived from the same group of hunters who reported hunting other upland game bird species.

**This is not the total of the columns because many upland game hunters hunted more than one species.

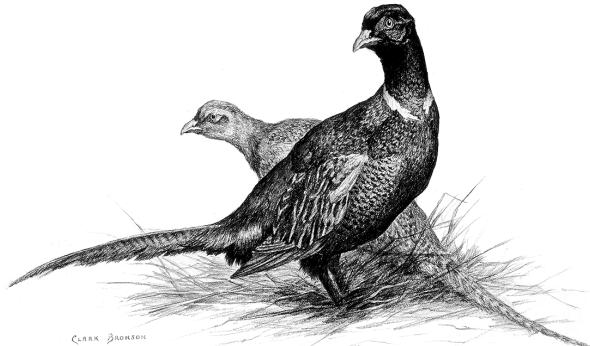

Table 3. Percent of hunter trips resulting in failure to bag at least one bird, 1961-99.

The upland game questionnaire is designed to monitor statewide harvest trend from year to year. The more extensively a species is hunted, the more accurately the questionnaire measures the trend data. In an effort to improve the accuracy of indices for species which receive very little hunting pressure and harvest, and which have low densities and limited distribution, a unique questionnaire for that species is mailed to the permit holder. This method has been used for band-tailed pigeon, wild turkey, sharp-tailed grouse and white-tailed ptarmigan.

The annual harvest report is sometimes criticized for being inaccurate and without value. However, report users must recognize that the accuracy of the questionnaire is based on some basic assumptions. These assumptions are: (1) the returned useable sample is a completely random sample, (2) respondents recorded data correctly, i.e., they clearly understood the questionnaire, (3) respondents recorded data accurately, did not guess or lie, and (4) respondents correctly identified species hunted. If these assumptions are not met, projections of harvest by county may be over-estimated due to nonrespondent or memory biases. Extreme caution should be used in the interpretation of estimated harvest and hunters for specific species in specific counties. Rather, the long-term trend in these indices should be used in managing the populations.

Presently, the Upland Game Annual Report contains the best data available and therefore constitutes the basic facts of upland game management. Although this report has its limitations, the trend data is valuable in making professional judgments regarding upland game populations and harvest.

The annual report is used in wildlife planning. It can be used to establish relative importance among species and for developing new resources through transplants or habitat developments. It points out areas of needed research by indicating problems and possible causes. It documents population trends and it combines all this inventory information into one easily accessible publication. Thus it is used extensively by federal land management agencies in environmental impact statements and management plans. It will become increasingly more important in developing management plans and assessing impacts on wildlife habitat.

Pheasant

The 1998-99 winter was very mild. Temperatures were well above normal in November through March, while precipitation was below normal in November through March.

During the nesting season, statewide monthly average temperatures were below normal (April-June). Average precipitation was above normal (April-August). Total pheasants observed on roadside routes was below 1998, while young per hen was the same as in 1998. The percentage of hens with young was 4 percent greater than in 1998.

Harvest statistics compiled from the questionnaire indicated approximately the same total pheasants harvested compared to 1998. Total harvest increased 3 percent from 1998, but remained 50 percent below the long-term average. Opening weekend success was down compared to the previous year based upon field bag check data.

The pheasant hunt is the most popular upland game hunt in Utah. Despite its popularity among Utah sportsmen, Utah's pheasant population continues to decline steadily. Primary reasons for population declines are due to outright losses of critical habitat and degradation of remaining habitat.

Beginning in 1997, one special youth (ages 12-15) youth pheasant hunt was provided in conjunction with the Box Elder County Cooperative Wildlife Management Unit. Approximately 75 youth hunters, recent graduates from Utah Hunter Education classes, participated in the hunt held on private property during the second Saturday of Utah's general pheasant season. The hunters were divided and allowed to go afield during a morning and afternoon hunt. Pen-reared pheasants were released prior to each hunt. Youth hunters were allowed to go afield, accompanied by a guardian, and had the opportunity to harvest two cock pheasants. Approximately 50% of the released pheasants were harvested.

Prior to going afield, youth hunters were provided with rules for the hunt and safety and ethics training. Upon returning from the field, youth hunters were provided with demonstrations on proper field dressing and game care.

In 1998, two youth pheasant hunts were provided-one on the Willard Bay and one on the James Walter Fitzgerald Wildlife Management areas. Hunts occurred on the second Saturday of the general pheasant season. Each wildlife management area (WMA) was closed to the general public during the youth hunts. A total of 200 youth hunters (100 at each WMA) participated in the 1998 hunts.

In 1999, four special youth pheasant hunts we offered; one on each of the following Wildlife Management areas: Willard Bay (100 hunters), James Walter Fitzgerald (100 hunters), Pahvant (100 hunters) and Mallard Springs (50 hunters).

The Conservation Reserve Program (CRP), begun in 1985 and reauthorized in 1996, has done little for Utah pheasant populations. Most CRP lands in Utah are in dryland farming areas. Pheasants prefer irrigated agricultural areas.

Breeding Territory Counts

Spring pheasant breeding territory counts have been conducted sporadically since 1993. Data on the number of territorial males per square mile are shown in Table 16. The number of territorial males in 1999 was up over the 1994-98 average.

Winter Sex Ratio Counts

Winter sex ratio counts provide an index as to how harvest of roosters only is affecting pheasant populations. In Utah, one rooster for every two, three or four hens is most common. One rooster for every ten hens is biologically acceptable in that one rooster can easily service ten hens in the wild. Based on this biological concept, hunting of rooster pheasants only does not appear to be affecting the populations.

Results of the survey for the winter of 1998-99 and long-term trends are shown in Tables 1 and 2 of this section. Statewide comparisons to the winter of 1997-98 and the 10-year (1989-98) average are as follows:

	<u>Winter of 1998-99</u>	<u>Percent change from 1997-98</u>	<u>Percent change from Average</u>
Total pheasants counted (roadside)	--	--	--
Hens per cock	--	--	--
Pheasants observed per 100 hours	--	--	--
Total hours effort (roadside)	--	--	--

Winter sex ratio data was not collected in Utah in the winter of 1998-99. This particular survey has been conducted for years in Utah. Rooster:hen ratios have never reached the point that biologists were concerned about impacts from hunting. This survey will be discontinued due to increased demands on personnel time.

Roadside Counts

A summary of summer roadside pheasant counts for 1999 is shown in Table 3. Long-term trends of pheasants per mile, young per mile, young per hen, percent of hens with young and mean brood size are found in Tables 4-8. Summer 1999 survey results compared to 1998 and the 10-year (1989-98) average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Total pheasants observed	558	-8	-20
Total miles driven	920.5	-14	-23
Pheasants per mile	0.61	+7	+8
Average brood size	4.91	-2	+2
Young per hen	3.54	0	-1
Percent of hens with young	72	+4	-5

Total pheasants observed decreased 8 percent while pheasants per mile increased 7 percent. Percent of hens with young increased 4 percent while average brood size decreased 2 percent.

Fewer pheasants were observed on roadside counts in 1999 than in 1998. However, reproductive success per adult hen and percentage of hens with young was the same or up from the previous year.

Harvest

Hunter Questionnaire

Results of the hunter questionnaire for 1999 are shown in Table 9. Long-term trends of pheasants bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 10-12, and total statewide harvest statistics in Table 13. A comparison of 1999 harvest statistics to 1998 and the previous 51-year average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Pheasant hunters	36,211	+3	-50
Pheasants harvested	77,545	0	-60
Hunter-days afield	120,502	-5	-42
Pheasants per hunter-day	0.64	+5	-27
Pheasants per hunter	2.14	-4	-16

Total hunters increased 3 percent from 1998 and remained 50 percent below the long-term average. Total harvest remained the same as in 1998. Hunter success (pheasants per hunter-day) increased 5 percent from 1998. Pheasants per hunter decreased 4 percent and remains 16 percent below the long-term average.

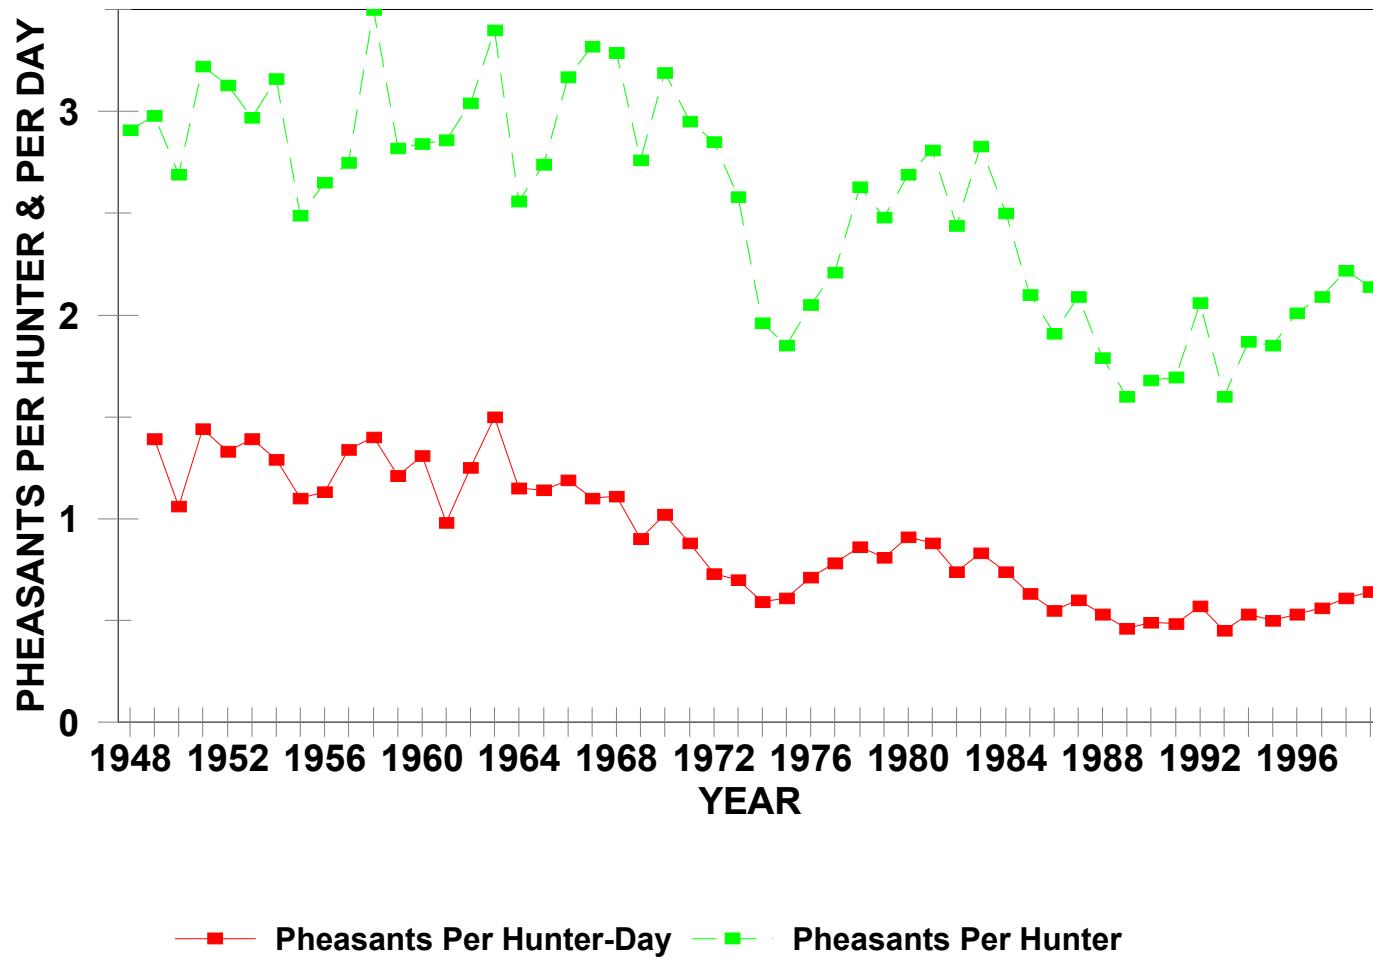

Long-term trends (1948-98) of total hunters, hunter-days, harvest and hunter success are shown in Figures 1 and 2. Generally, the recent trend is toward less hunter-days with declines in total pheasants harvested and hunter success. We believe this is the result of the accumulated effects of loss of quantity and quality of habitat due to urbanization, flooding, modern agricultural practices, and habitat fragmentation resulting in increased predation.

Cache County accounted for 18.38 percent of the entire pheasant harvest, while Box Elder County accounted for 15.91 percent and Utah County for 15.84 percent.

Figure 1. Statewide trends of pheasant harvest statistics, 1948-99.

**Figure 2. Statewide trends of pheasant
hunter success rates, 1948-99.**

Field Bag Checks

Field bag checks provide an index of opening day or weekend hunter harvest success rates.

A summary of pheasant field bag check data for 1999 is shown in Table 14. The hunter success trend determined via bag checks since 1993 is found in Table 15. A comparison of 1999 data, on a statewide basis, to 1998 and the 10-year (1989-98) average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Total hunters checked	279	+43	-54
Total hours hunted	645	+62	-61
Pheasants per hunter (complete hunts)	0.38	-17	+3
Pheasants bagged per 100 hours	16	-33	-9
Average hours per hunter-day (complete hunts)	2.35	+23	+1
Hours hunted per pheasant bagged (complete hunts)	6.17	+50	+4

In 1999, hunters spent 23 percent more time afield on an average day during the opening weekend. Hours hunted per pheasant bagged increased 50 percent. Pheasants per hunter decreased 17 percent over 1998 but was 3 percent above the 10-year average.

Migratory Upland Game Birds

Mourning Dove

The breeding density index increased 96 percent in 1999, and was 11 percent above average.

Harvest statistics derived from the questionnaire indicated an increase in number of hunters, but a slight decrease in harvest compared to 1998.

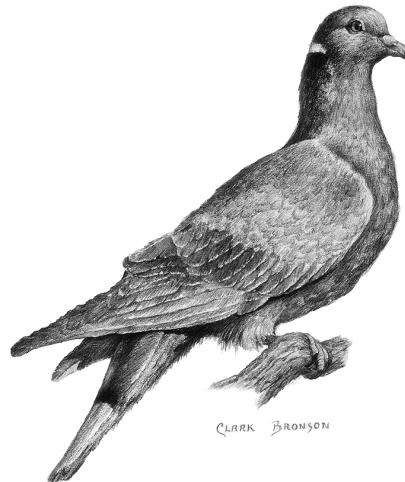

Beginning in 1998, Utah mourning dove and band-tailed pigeon hunters were required to register under the federally mandated, Migratory Game Bird Harvest Information Program (HIP). The purpose of HIP is to ensure standardized harvest data collection for migratory game birds. HIP is administered by the U.S. Fish and Wildlife Service.

Field bag checks indicated a decrease in hunter success on opening day. Hunters who participated hunted more hours per day than the previous year, and spent more time afield per dove harvested.

Aging of wings indicated the juvenile per 100 adult ratio increased to 138 compared to 120 in 1998. Juvenile per 100 adult ratio was 38 percent above the long-term average.

Band-tailed Pigeon

A free band-tailed pigeon hunting permit was required in 1999 to obtain mailing addresses for a harvest questionnaire. Pigeon hunters were also required to register in the HIP program. One hundred nine hunters obtained permits and only 49 went afield. One hundred three pigeons were harvested. The majority of the harvest occurred on the LaSal Mountains.

MOURNING DOVE

Call Count Survey

Results of the 1999 call count survey are found in Table 1 of this section. The long-term trend of the state's breeding density index (average doves heard per route) is shown in Table 2. Indices shown in each of these tables are unweighted and consequently differ from those published in the annual Mourning Dove Status Report compiled by the U.S. Fish and Wildlife Service. However, indicated trends are similar (Figure 1). The following is a comparison of the results of the 1999 survey compared to 1998 and the 10-year(1989-98) average:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Average doves heard per route	10.47	+96	+11
Average doves seen per route	5.33	+60	-37

Coo count data (doves heard per route) indicated substantially increased breeding activity in late May compared to 1998, and was 11 percent above the long-term average of doves heard per route.

Harvest

Hunter Questionnaire

Information obtained from the hunter questionnaire for 1999 is summarized in Table 3. Long-term trends of mourning doves bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 4-6 and total statewide harvest statistics in Table 7 and Figures 2 and 3. The following is a comparison of the harvest statistics for 1999 compared to 1998 and the previous 48-year average:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Mourning dove hunters	20,926	+16	-5
Mourning doves harvested	153,487	-4	-25
Hunter-days afield	63,796	-5	-9
Mourning doves per hunter-day	2.41	+1	-25
Mourning doves per hunter	7.33	-17	-19

Hunter success increased slightly from 1998. Total harvest decreased 4 percent compared to 1998. Numbers of dove hunters increased 16 percent and hunter-days afield decreased 5 percent. Doves per hunter decreased 17 percent from 1998.

Figure 1. Mourning dove breeding density index trend, 1964-99.

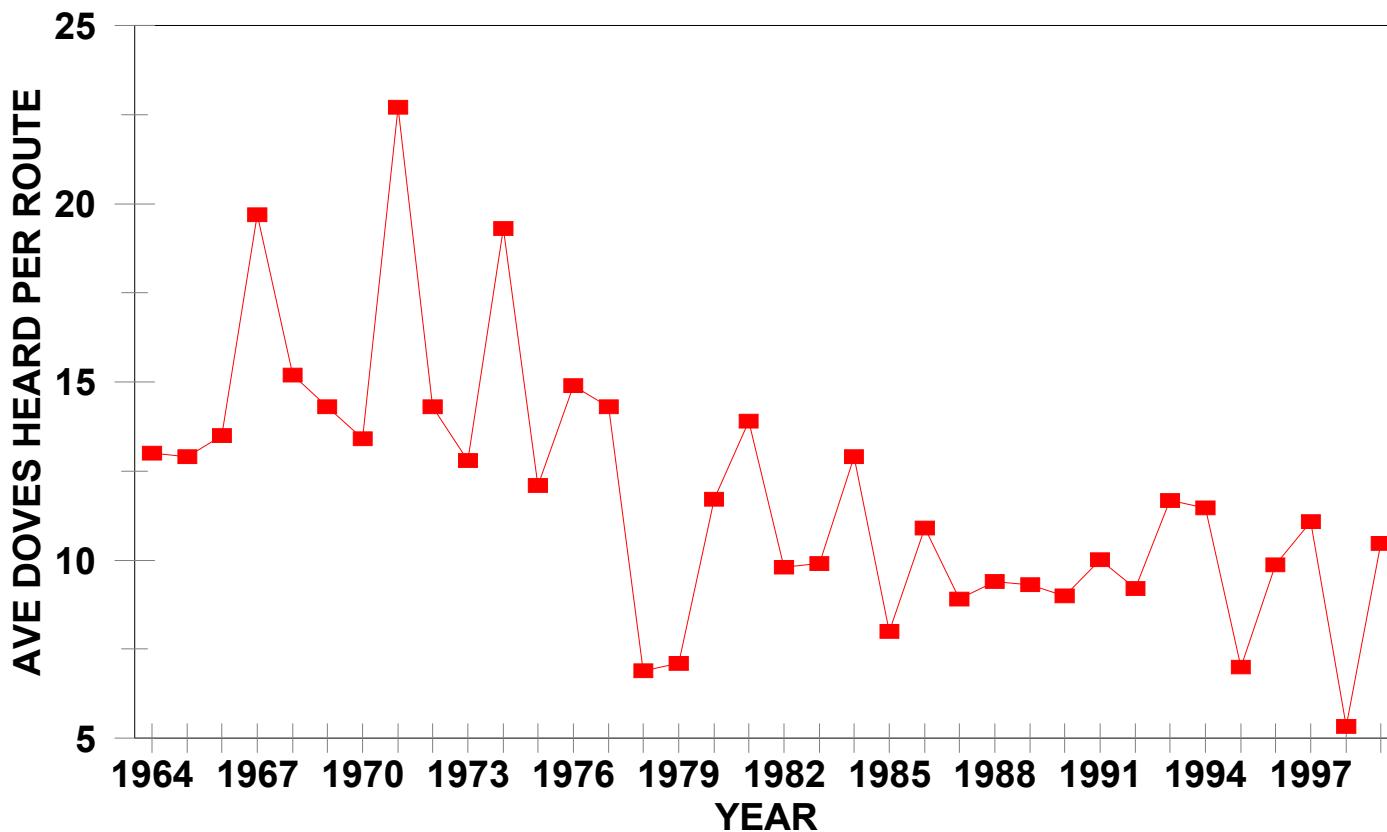

Figure 2. Statewide trends of mourning dove harvest statistics, 1951-99.

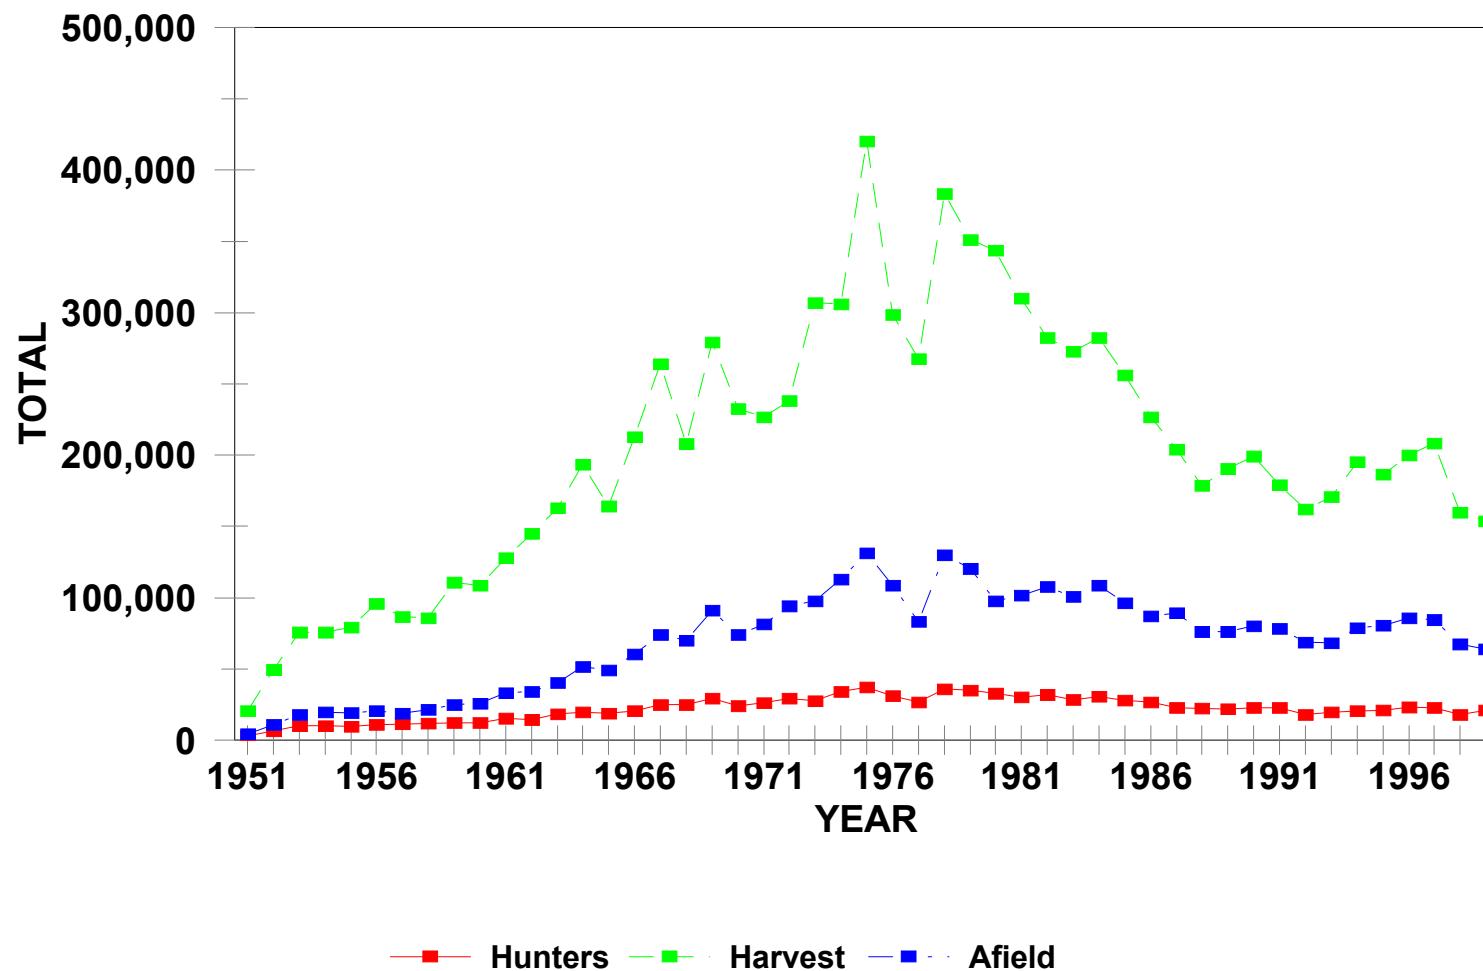

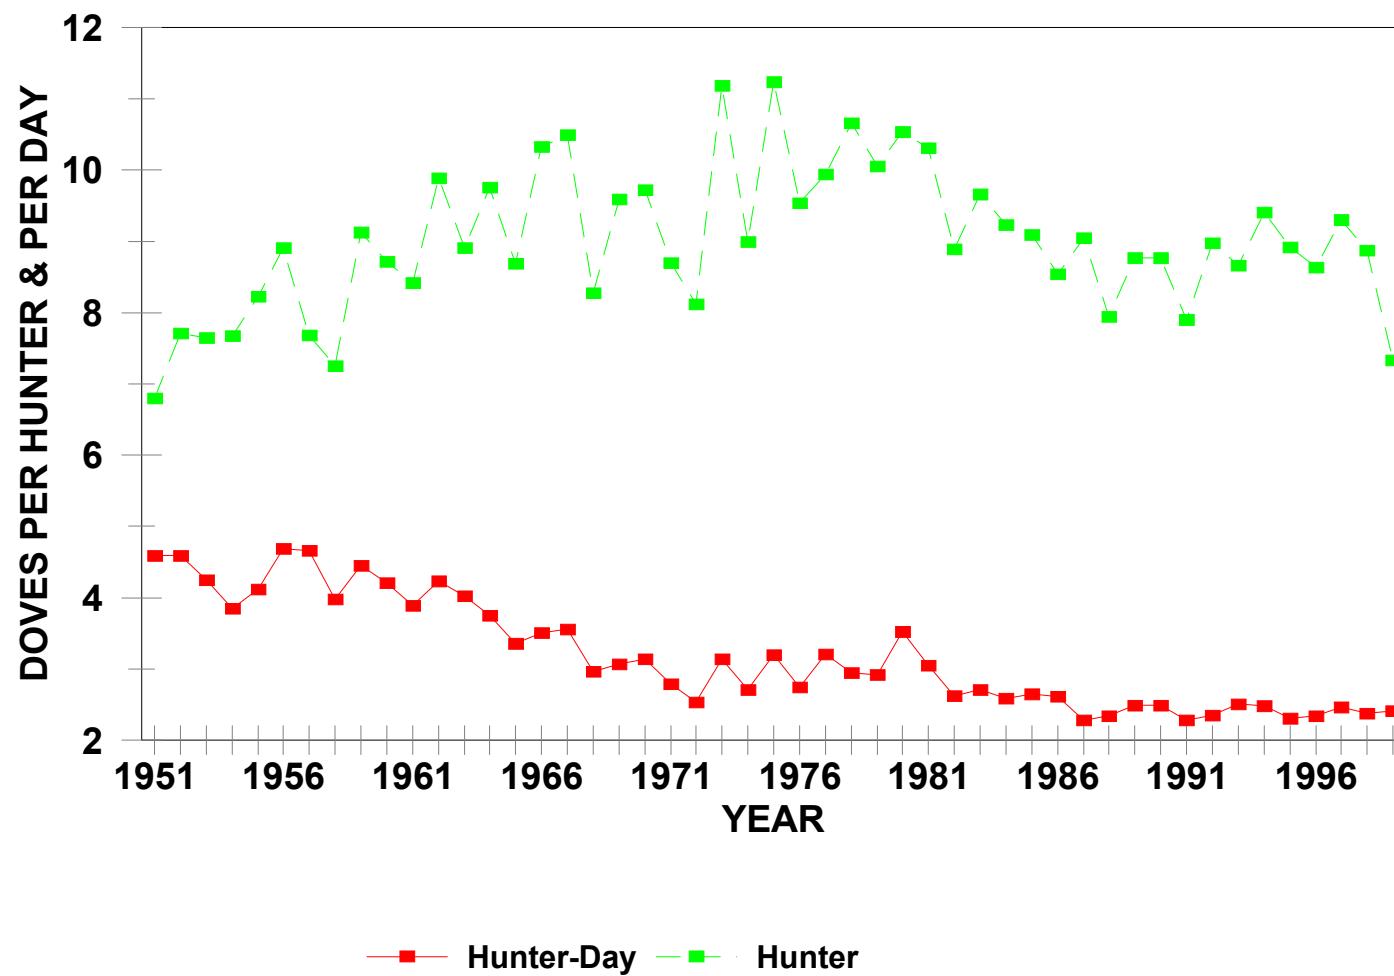

Figure 3. Statewide trends of mourning dove hunter success rates, 1951-99.

Field Bag Checks

A summary of field bag check data for 1999 is shown in Table 8. Hunter success trends determined via this method are shown in Table 9. Results of the 1999 survey compared to 1998 and the 10-year average (1989-98) follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Total hunters checked	262	-47	-66
Total hours hunted	674	-55	-77
Doves per hunter (complete hunts)	1.75	0	-35
Doves bagged per 100 hours (complete hunts)	43	-2	-41
Average hours per hunter-day (complete hunts)	4.10	+4	+8
Hours hunted per dove bagged (complete hunts)	2.35	+4	+57

Field bag checks indicated an opening day decrease in hunter success. The total number of hunters checked was down 47 percent from 1998. Dove hunters spent more time afield per hunter-day than in 1998, and more time was spent per dove bagged.

Age Composition of the Harvest

A summary of the age composition of harvested mourning doves from 1989 through 1999 is contained in Table 10. Hatching dates for immature doves harvested in Utah since 1990 are shown in Table 11.

Following is a comparison of data collected in 1999 compared to 1998 and the 10-year average (1989-98):

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Sample size	274	-56	-83
Immatures/100 adults	138	+15	+38
Percent hatched August 3+	43	-22	+32
Percent hatched July 25+	82	-2	+82
Percent hatched before July 25	18	+13	+29

Sample size decreased 56 percent in 1999. The 120 immatures per 100 adults in the harvest was up 15 percent from the previous year and is 38 percent above the long-term average.

BAND-TAILED PIGEON

Banding

Between 1969 and 1978, 2,649 total pigeons were banded in Utah and 975 recaptured. Results of banding efforts through 1972 indicated a direct recovery rate of 1.4 percent. If expanded, using an assumed 30 percent band reporting rate, an estimated harvest rate of less than 5 percent of the state's pigeon population is indicated. Addition of an estimated 16 percent crippling loss would result in a total kill rate of from 5-10 percent, well within the harvestable surplus.

Harvest

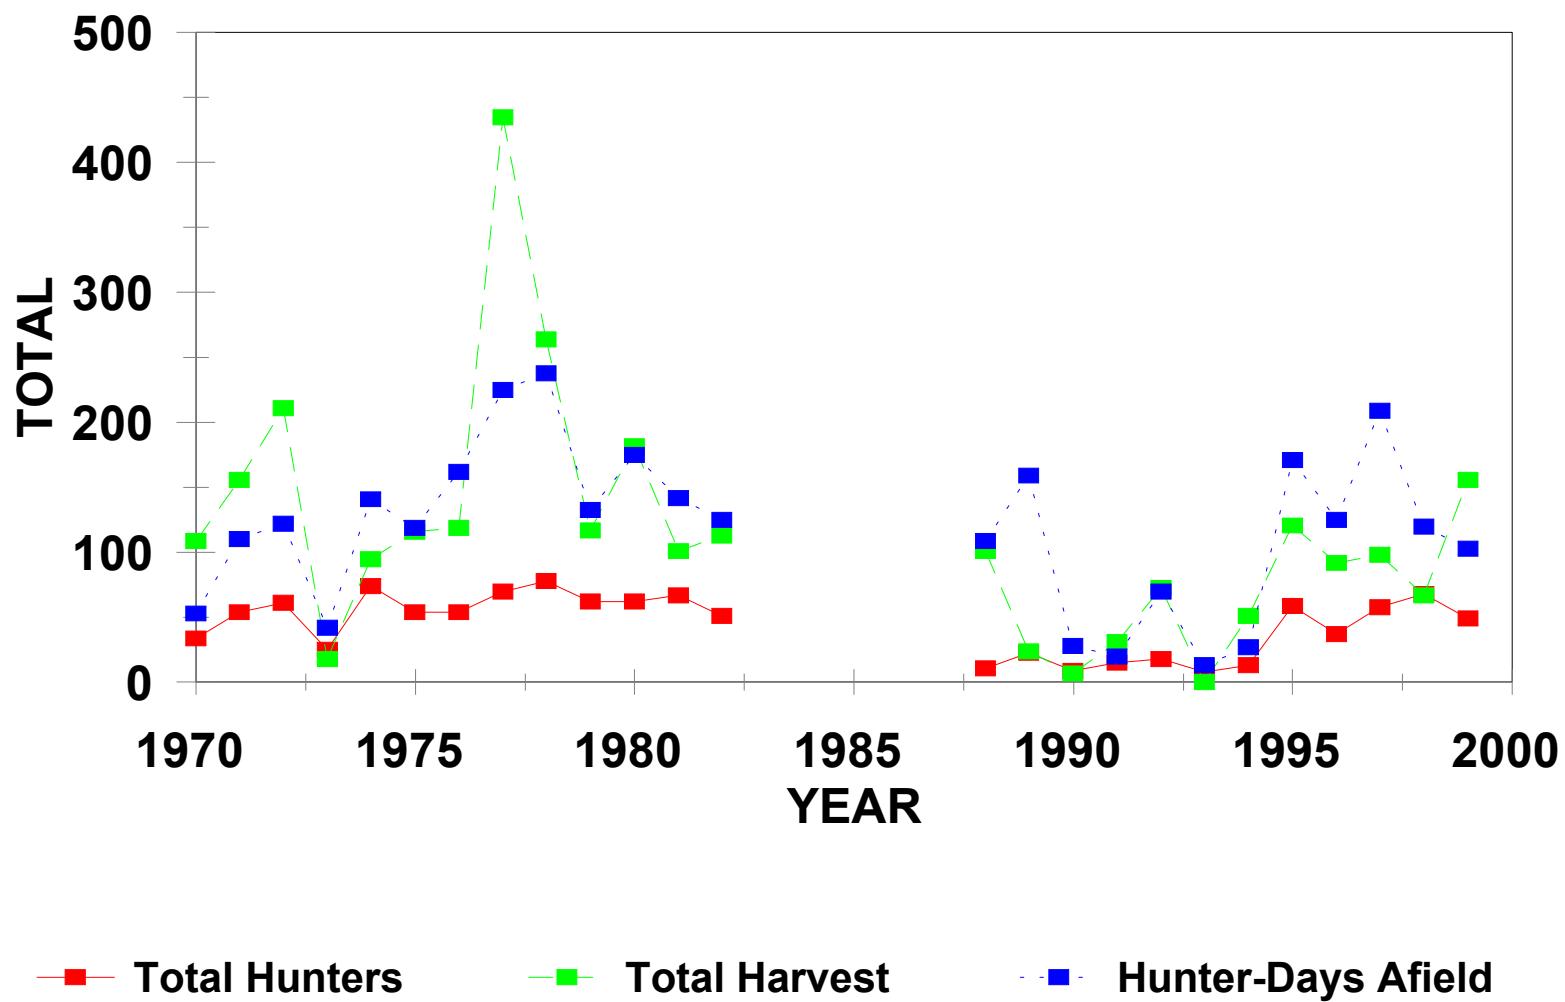

Results of the 1999 band-tailed pigeon harvest is in Table 13. Free hunting permits were required in 1999 as well as registration in the HIP program. A harvest questionnaire was sent to participants. Only 109 hunters obtained the band-tailed pigeon permit in 1999. Harvest trends since 1970 are shown in Figures 4 & 5 and Table 14.

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Band-tailed pigeon hunters afield	49	-28	+10
Band-tailed pigeon harvest	103	+54	-9
Hunter-days afield	156	+30	+32
Pigeons per hunter-day	0.66	+18	-33
Pigeons per hunter	2.10	+112	-23

Band-tailed pigeon hunters afield decreased from 1998, but was 10 percent above the long-term average.

One hundred three pigeons were estimated to have been harvested in 1999.

Chukar Partridge

Late winter and early spring precipitation, critical to successful chukar production, was normal in 1999 (Figure 3).

Results of the aerial survey indicated that chukars per square mile was down 34 percent over 1998.

Harvest statistics from the general mail questionnaire reflected an 80 percent increase in total harvest by 55 percent more hunters than in 1998. Hunter success (chukars per hunter-day) increased 10 percent from 1998 while time afield increased 63 percent.

Aerial Survey

Results of the annual aerial survey for 1999 are shown in Table 1 of this section. Following are the survey results for 1999 compared to 1998 and the 1996-98 average.

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Coveys flushed	65	+25	+138
Total chukars observed	623	-34	+40
Chukars per square mile	77.88	-34	+37
Chukars per survey hour	356.00	-49	+3

This population survey technique was implemented in 1996. The survey allows for rapid counting of localized chukar populations versus ground brood count surveys. Chukars observed per square mile decreased 34 percent over 1998. Chukars observed per survey hour decreased 49 percent over 1998.

Harvest

Hunter Questionnaire

Results of the hunter questionnaire survey for 1999 are shown in Table 2. Long-term trends of chukars bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 3-5 and total statewide harvest statistics in Table 6 and Figures 1 and 2. Following is a comparison of 1999 harvest statistics to 1998 and the previous 41-year average:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Chukar hunters	14,388	+55	+9
Chukars harvested	64,727	+80	+76
Hunter-days afield	53,842	+63	+33
Chukars per hunter-day	1.20	+10	+37
Chukars per hunter	4.50	+16	+67

Chukar hunters and hunter effort increased from 1998. Chukars per hunter-day increased 10 percent from 1998 and was 37 percent above the long-term average. Total harvest increased 80 percent in 1999.

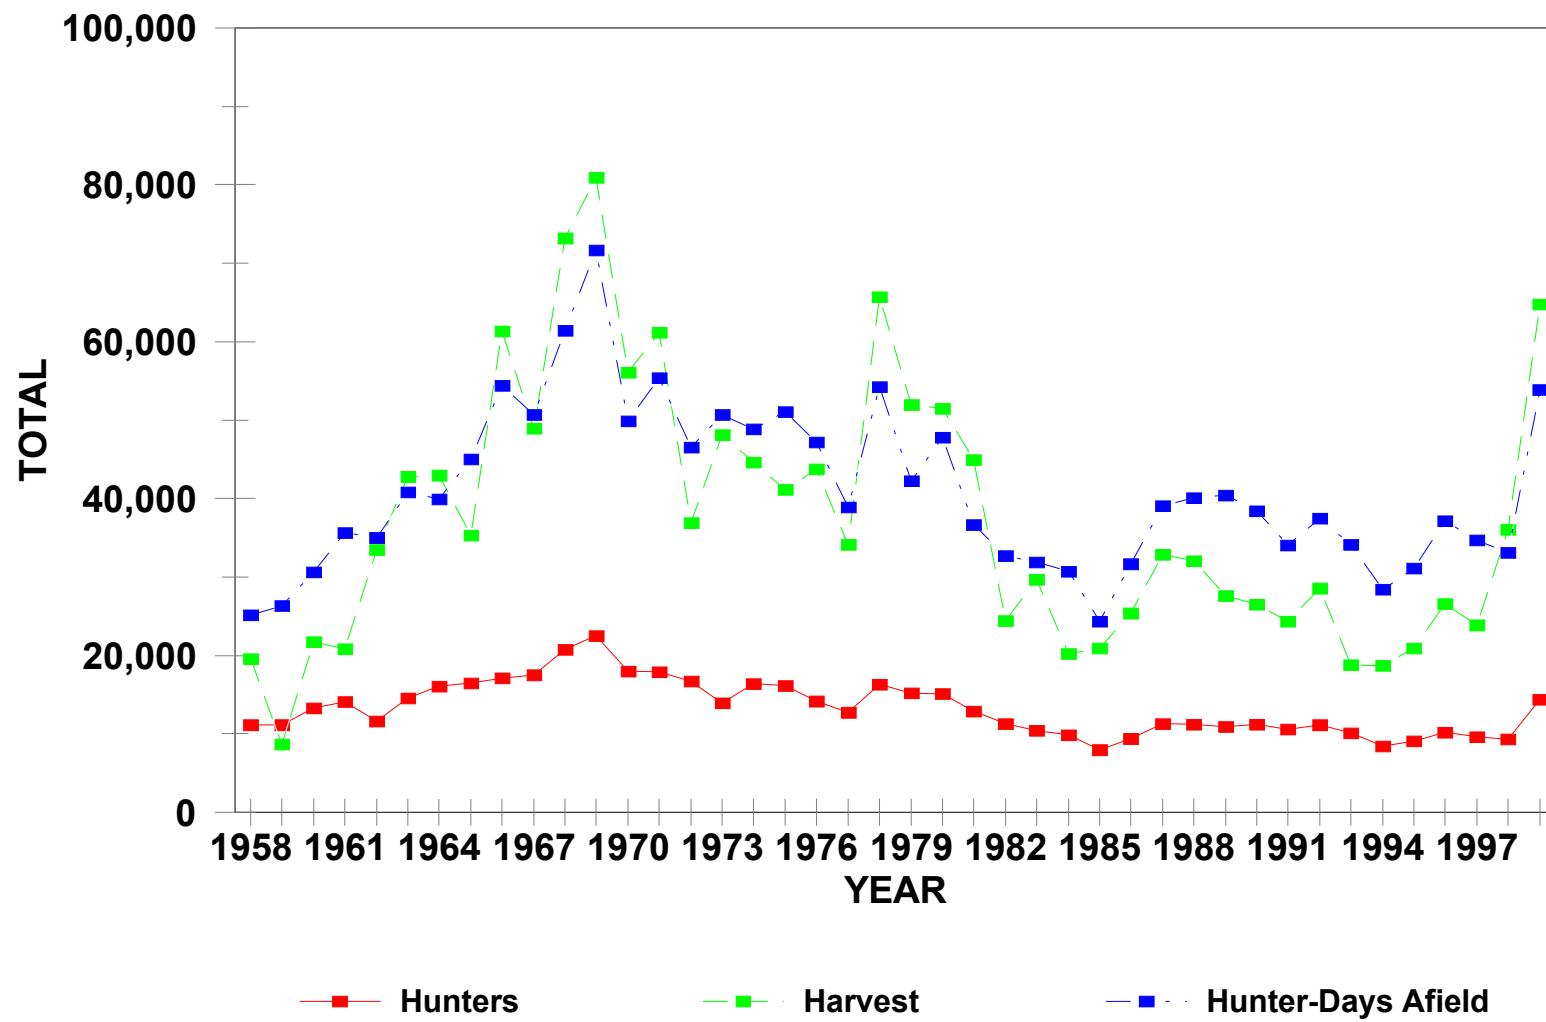

Field Bag Checks

A summary of field bag check data for 1999 is shown in Table 7. The hunter success trend determined via this method are shown in Table 8. Data for the 1999 season compared to 1998 and the 10-year (1989-98) average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Total hunters checked	1	-99	-97
Total hours hunted	2	-99	-99
Chukars per hunter (complete hunts)	2.00	+108	+27
Chukars bagged per 100 hours (complete hunts)	100	+257	+130
Average hours per hunter-day (complete hunts)	2.00	-42	-48
Hours hunted per chukar bagged (complete hunts)	1.00	-72	-70

Total hunters checked in 1999 decreased over 1998.

Figure 1. Statewide trends of chukar partridge harvest statistics, 1958-99.

Sage Grouse

Strutting ground count surveys indicated a 13 percent increase in the average male grouse attendance from 1998.

Brood surveys showed decreased production per 100 adults throughout the state. Birds observed per 100 hours increased 197 percent from 1998, and was 675 percent above average.

Total harvest was 39 percent below the long-term average. Hunter numbers increased 36 percent in 1999 and remained 33 percent below the long-term average.

Since 1959, numerous new strutting grounds have been discovered throughout Utah. However, average number of male grouse per ground has declined.

Recent DNA and physiological studies indicate that two distinct species of sage grouse exist in Utah. The smaller species is located south and east of the Colorado River and is known as the Gunnison sage grouse.

Declines in sage grouse populations are attributed to loss and changes in sage brush habitats throughout the West. Spraying, urban and industrial development, burning and overgrazing by domestic livestock have altered critical sage grouse habitat.

There is much discussion about the status and future of sage grouse at the "Western States" level. Utah should place high priority on collecting as much annual biological data as possible on sage grouse populations in order to make the best management decisions possible.

Strutting Ground Counts

The status of the sage grouse breeding population for 1999, as indicated by strutting ground counts, is shown in Table 1 and Figure 1 of this section. Results of this survey for 1999 compared to 1998 and the 1959-98 average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Number of grounds counted	158	+15	+69
Total male grouse counted	2,847	+34	+74
Average male grouse per ground	18	+13	-9
Percent change from previous year (comparable grounds)	--	--	--

Access for spring 1999 strutting ground counts was good in most regions of the state. The numbers of male grouse observed increased 15 percent statewide and average number of males per ground increased 34 percent over 1998.

Brood Counts

Results of the summer inventory survey for 1999 are found in Table 2. Long-term trends of young per adult ratios, mean brood size and sage grouse observed per 100 hours are shown in Tables 3-5. Indices for 1999 are compared to 1998 and the previous 10-year (1989-98) average as follows:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Total sage grouse counted	219	-69	-62
Young per 100 adults	109	-59	-38
Mean brood size	4.04	-10	-8
Sage grouse observed per 100 hours	2738	+197	+675
Total hours effort	8	-90	-96

The effort devoted to sage grouse brood counts was 96 percent below average, and the total number of grouse counted was 62 percent above average.

Total sage grouse counted decreased 69 percent in 1999, while production of young per 100 adults decreased 59 percent. The average brood size was 8 percent below the 10-year average.

Figure 1. Statewide trends of average sage grouse males per lek, 1959-99

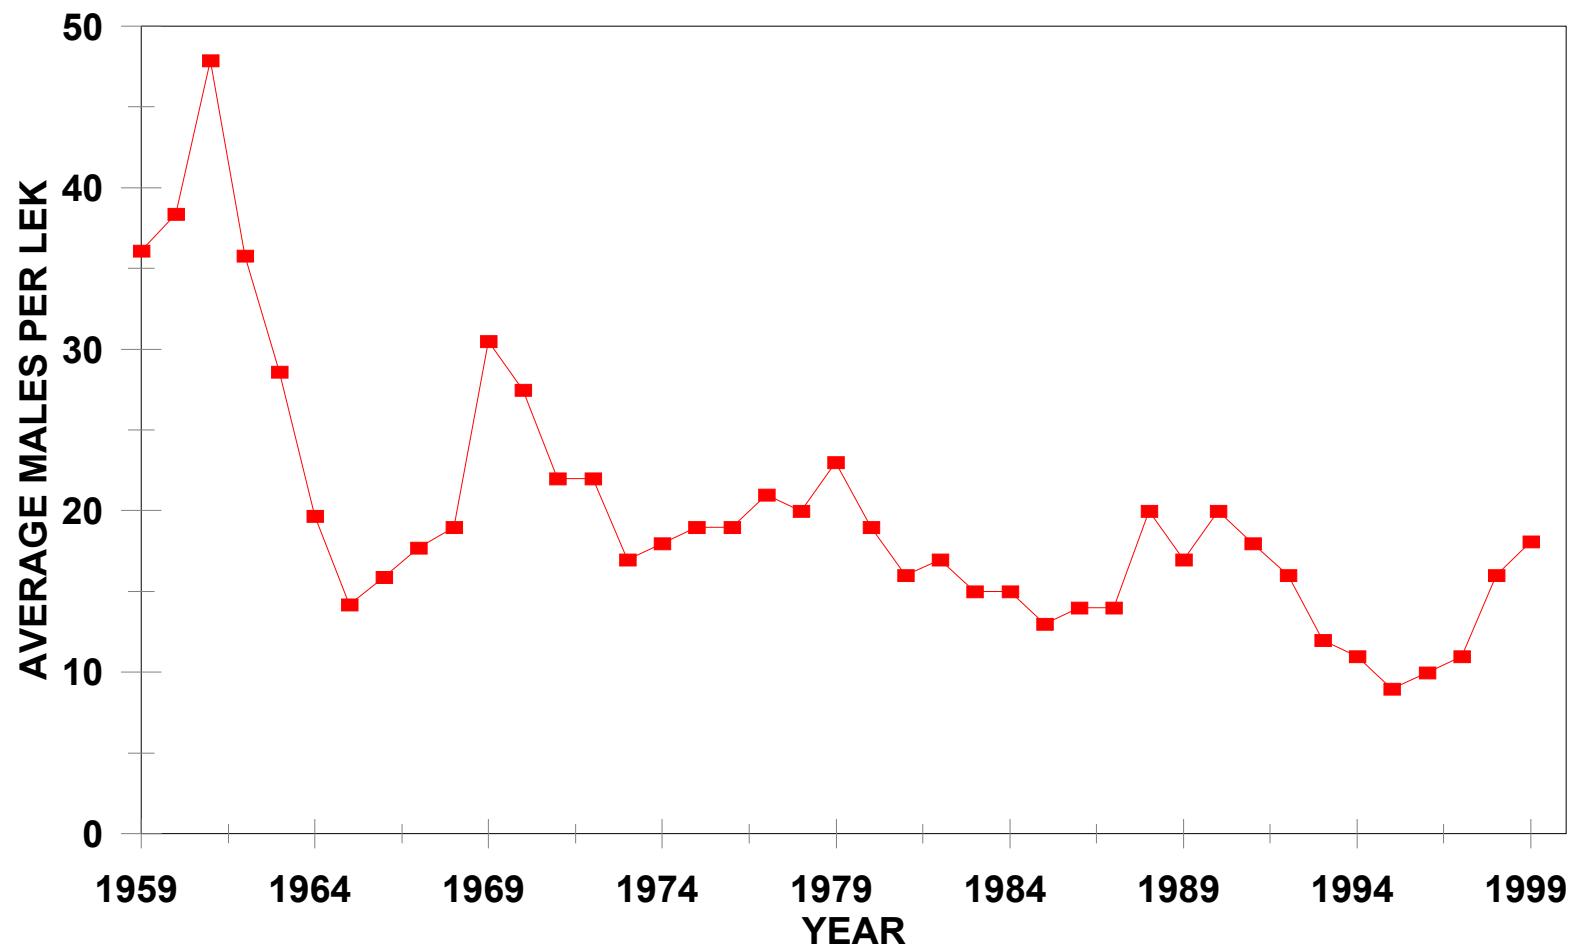

Figure 2. Statewide trends of sage grouse harvest statistics, 1963-99.

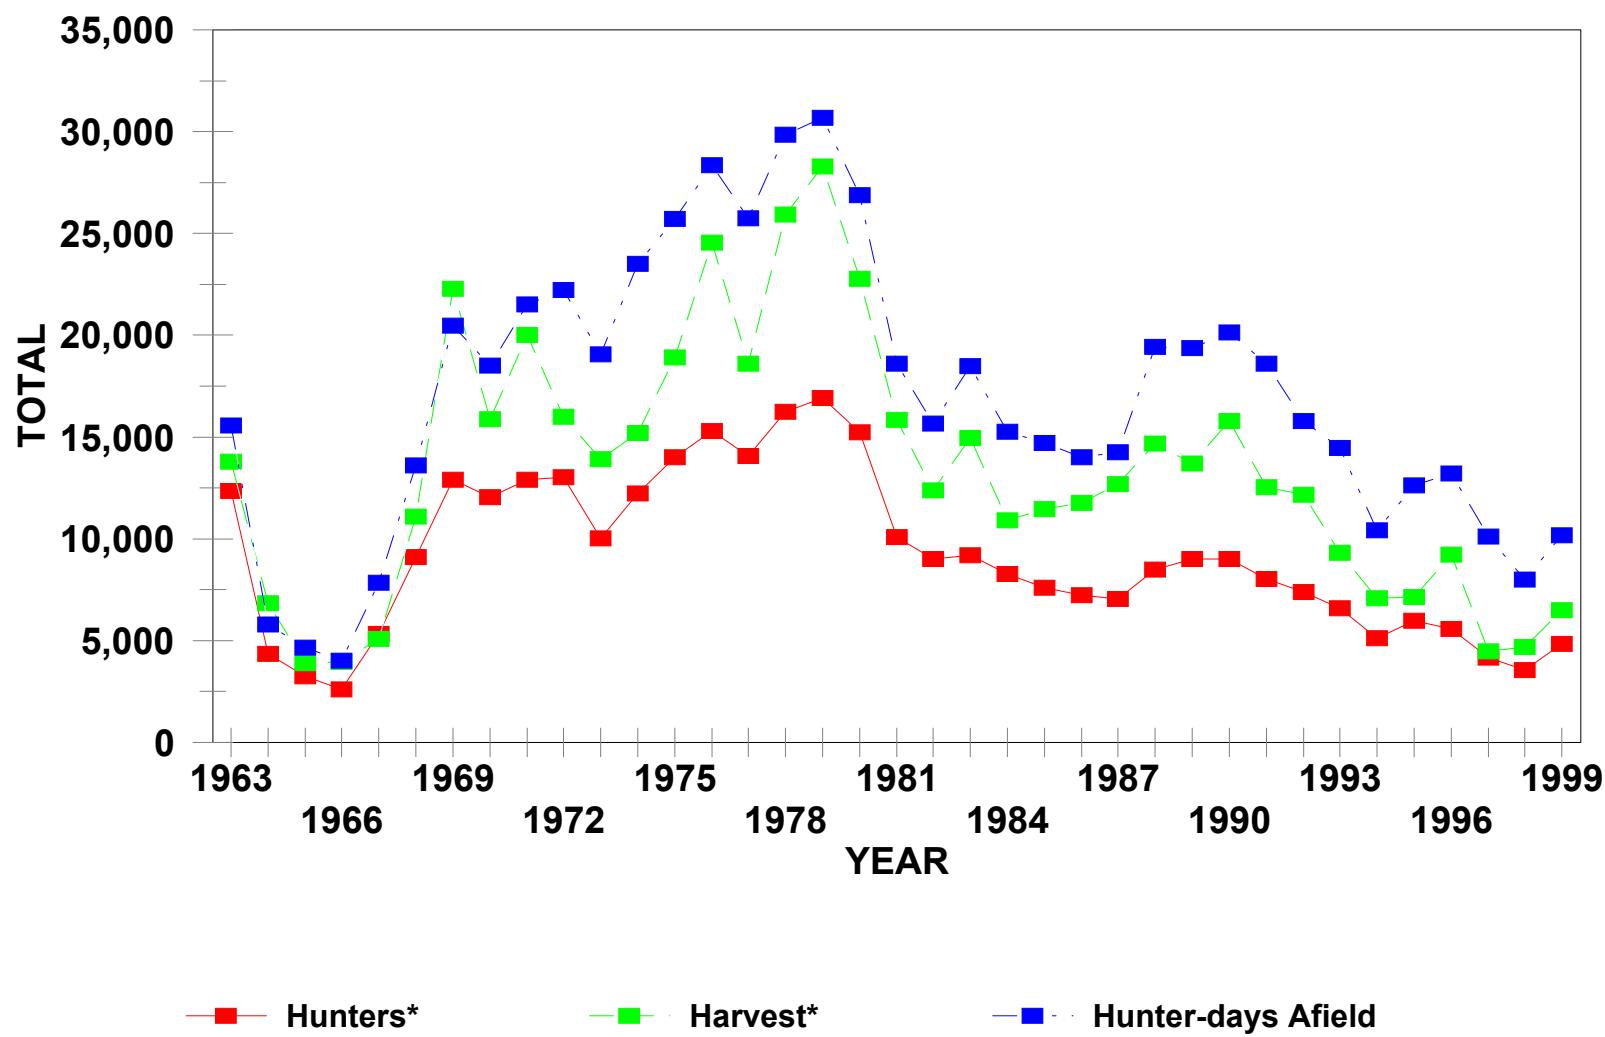

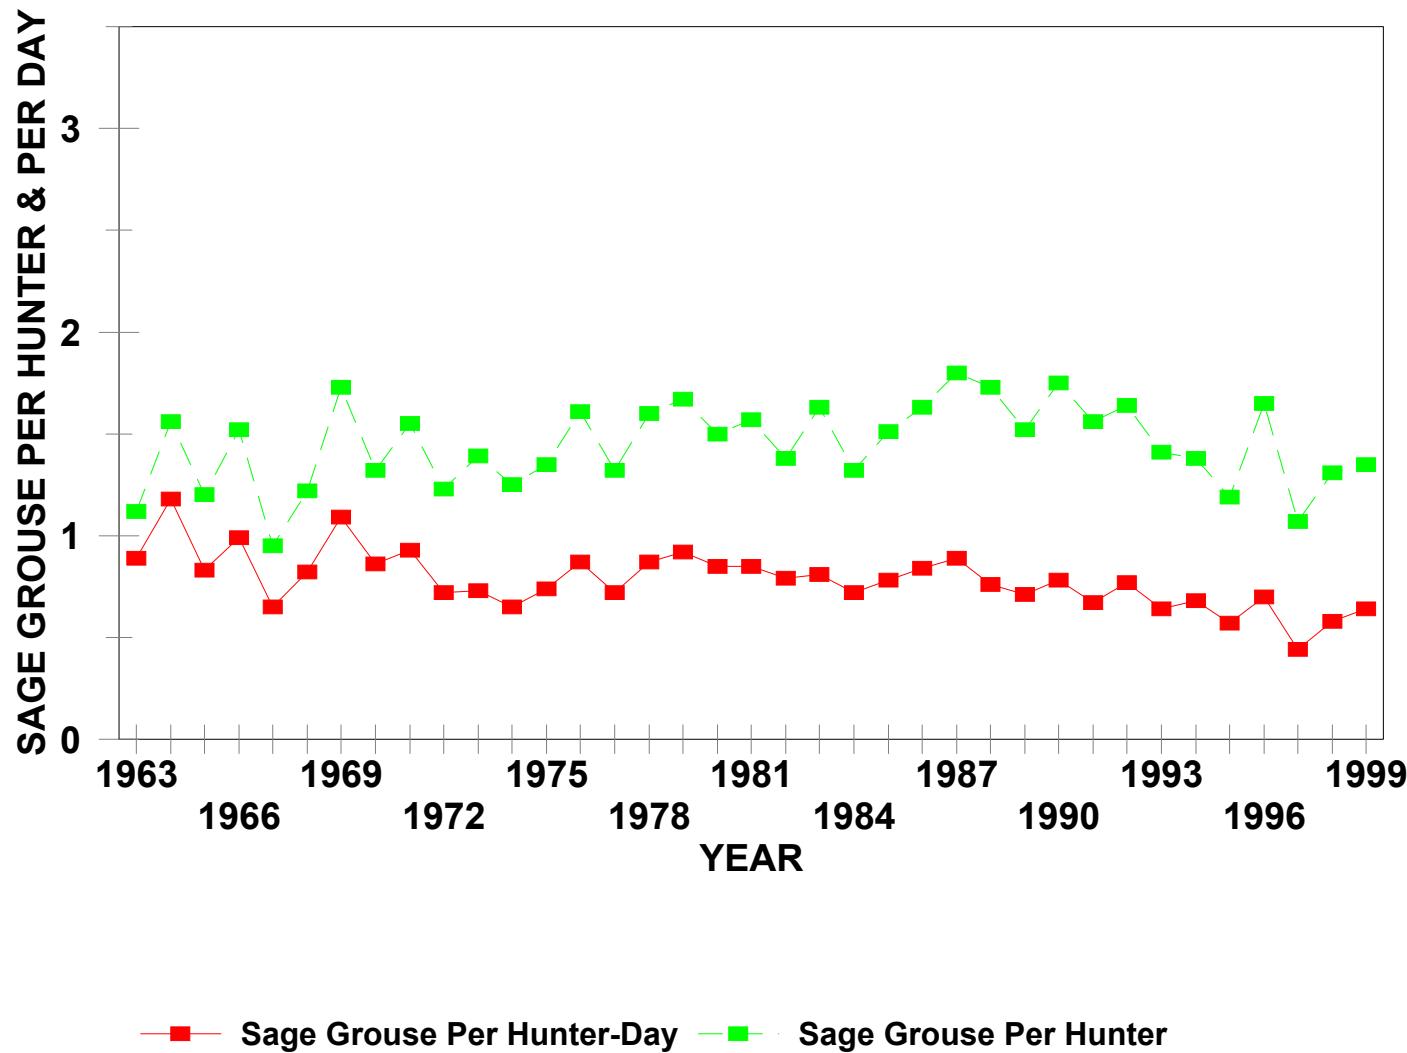

Figure 3. Statewide trends of sage grouse hunter success rates, 1963-99.

Harvest

Hunter Questionnaire

Results of the 1999 hunter questionnaire are shown in Table 6. Long-term trends of sage grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 7-9 and total statewide harvest statistics in Table 10. The results of the 1999 hunting season compared to 1998 and the previous 48-year average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Sage grouse hunters	4,830	+36	-33
Sage grouse harvested	6,503	+39	-39
Hunter-days afield	10,161	+27	-22
Sage grouse per hunter-day	0.64	+10	+5
Sage grouse per hunter	1.35	+3	-24

Sage grouse per hunter-day success rate increased 10 percent in 1999. Total statewide harvest increased 39 percent, and there was a 36 percent increase in total sage grouse hunters.

Long-term sage grouse harvest trends are shown in Figures 2 and 3.

Field Bag Checks

A summary of field bag check data for 1999 is shown in Table 11. Hunter success trends determined via this method are shown in Table 12. Results of the 1999 survey compared to 1998 and the 10-year (1989-98) average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Total hunters checked	103	-34	-77
Total hours hunted	442	-23	-81
Sage grouse per hunter (complete hunts)	0.53	-25	-31
Sage grouse bagged per 100 hours	12	-37	-32
Average hours per hunter-day (complete hunts)	4.29	+17	-7
Hours hunted per grouse bagged (complete hunts)	8.04	-59	-26

Hunter success rates from field bag checks showed decreased success on the opening weekend of 1999. Sage grouse bagged per 100 hours decreased 25 percent. Average hours per hunter-day increased 17 percent from 1998. Average hours per grouse bagged decreased 59 percent.

Sex and Age Composition of the Harvest

A summary of the sex and age composition of harvested sage grouse in 1999 is found in Table 13 and the trend from 1995-99 in Table 14.

Following are data derived from wing surveys in 1999 compared to 1998 and the 10-year (1989-98) average:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Sample size	358	+12	-45
Percent males	44	+2	+11
Percent females	56	-2	-7
Young per 100 adults	202	-41	-17
Young per 100 hens (adult)	129	-34	+1
Percent successfully nesting females			
Adults	29		
Yearlings	42		
All	23		

Analysis of wings collected at checking stations during the 1999 season indicates that statewide production (young/100 adults) was down 41 percent compared to 1998, and was 17 percent below the 10-year average.

Table 13. Sex and age composition of harvested sage grouse, 1999.

Forest Grouse

Blue Grouse

CLARK BRONSON

Forest grouse brood count data is only collected opportunistically. Based on small sample sizes, young per 100 adults for both ruffed and blue grouse increased over 1998.

Total harvest increased 124 percent from 1998. Total hunters and days afield also increased.

Based on analysis of hunter harvested grouse wings, ruffed grouse production was up slightly from 1998 and blue grouse production decreased. Forty-six percent of blue grouse harvested were males, while 54 percent were females.

Ruffed Grouse

CLARK BRONSON

Brood Counts

Ruffed Grouse

Results of the annual random brood survey for 1999 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and ruffed grouse observed per 100 hours are found in Tables 2-4. A summary of effort expended on ruffed and blue grouse brood counts combined is shown in Table 9. Survey results for 1999 compared to 1998 and the previous 10-year (1989-1998) average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Total ruffed grouse observed	7	+100	--
Young per 100 adults	600	+100	--
Mean brood size	6.00	+100	--
Ruffed grouse observed per 100 hours	--	--	--
Total hours effort	--	--	--

No specific effort was expended to collect ruffed grouse brood count data in 1999. This data is collected opportunistically.

Blue Grouse

Results of the annual random brood survey for 1999 are shown in Table 5 of this section. Long-term trends of young per adult ratios, mean brood size and blue grouse observed per 100 hours are found in Tables 6-8. Survey results for 1999 compared to 1998 and the 10-year (1989-1998) average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Total blue grouse observed	132	-25	-14
Young per 100 adults	277	+19	+9
Mean brood size	3.81	+9	+3
Blue grouse observed per 100 hours	--	--	--
Total hours effort (forest grouse)	--	--	--

The 1999 brood count surveys on blue grouse indicated that production increased 19 percent from 1998 and was 9 percent above average. This data is collected opportunistically.

Harvest

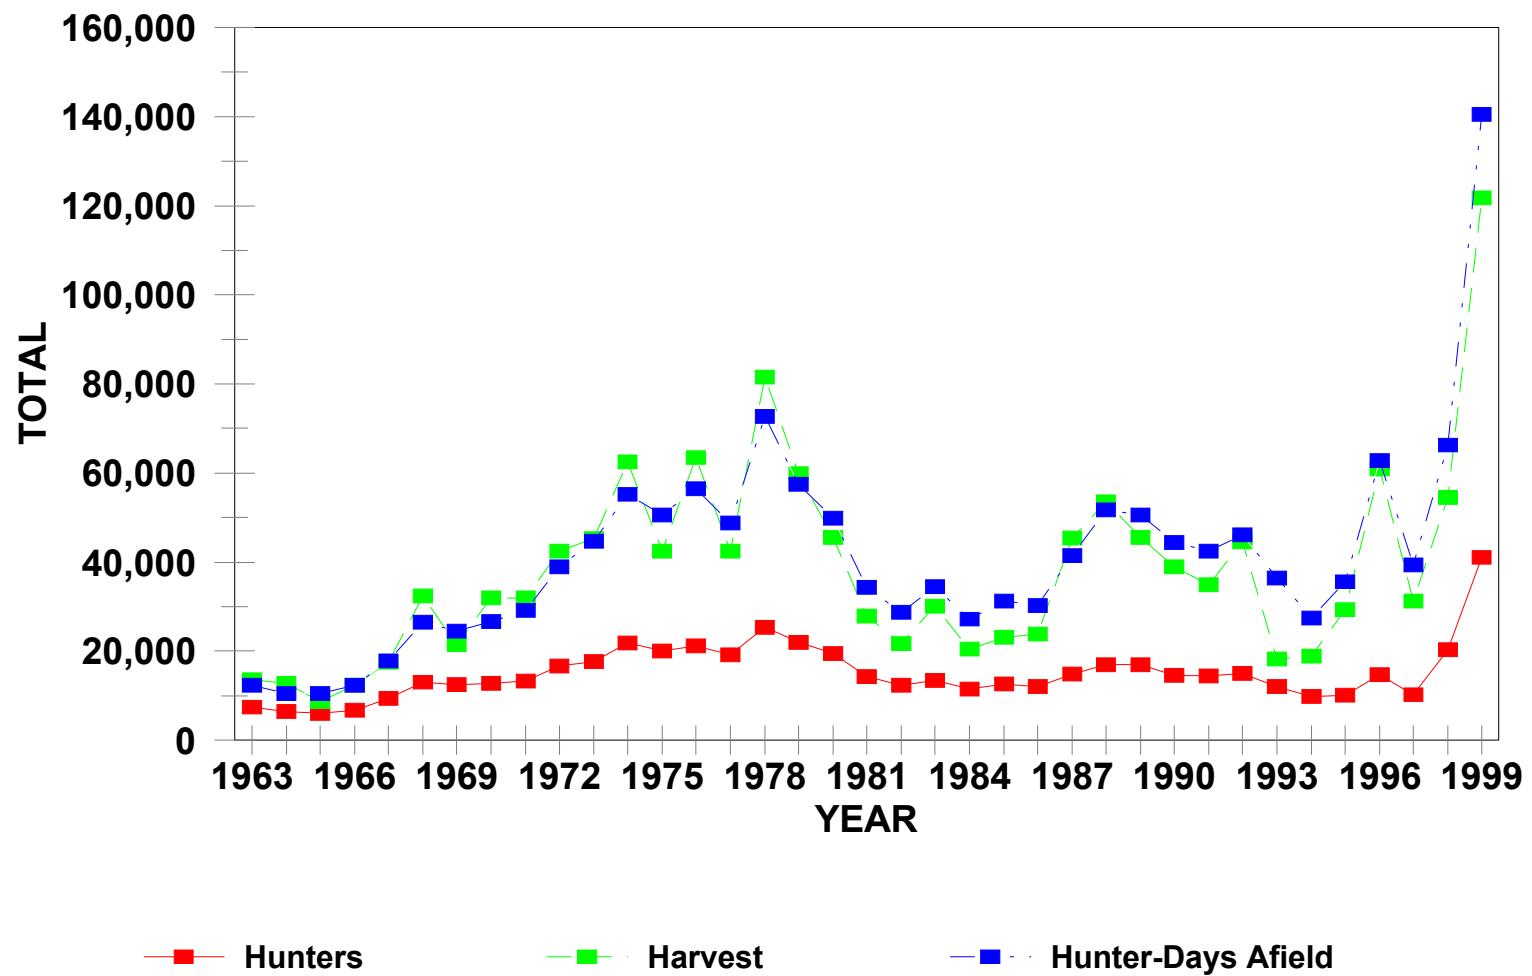

Hunter Questionnaire

Results of the 1999 ruffed grouse, blue grouse and combined hunter questionnaire are shown in Tables 10, 11 and 12 respectively. Long-term trends of forest grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 13-15 and total statewide harvest statistics in Table 16 and Figures 1 and 2. Forest grouse season length, bag limits and harvest statistics for 1963-99 are listed in Table 17. Harvest statistics for 1999 compared to 1998 and the 36-year average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Forest grouse hunters	41,041	+102	+185
Forest grouse harvested	121,708	+124	+239
Hunter-days afield	140,478	+112	+267
Forest grouse per hunter-day	0.87	+5	-7
Forest grouse per hunter	2.97	+11	+24
Percent ruffed grouse	26.31	+14	-32
Percent blue grouse	23.61	-13	-57
Percent unidentified	50.08	+1	+673

Total harvest increased 124 percent from 1998 and was 234 percent above average. Overall, hunter success (grouse per hunter-day) increased 5 percent in 1999, but remains 7 percent below average. The number of grouse harvested per hunter was 24 percent above average.

**Figure 1. Statewide trends of forest
grouse harvest statistics, 1963-99.**

**Figure 2. Statewide trends of forest
grouse hunter success rates, 1963-99.**

Field Bag Checks

A summary of field bag check data for 1999 is shown in Table 18. Hunter success trends determined via this method are shown in Table 19.

Results of the 1999 survey compared to 1998 and the 10-year (1989-98) average follow:

	<u>1999</u>	Percent change from <u>1998</u>	Percent change from <u>Average</u>
Total hunters checked	139	+458	-58
Total hours hunted	684	+1296	-31
Forest grouse per hunter (complete hunts)	0.78	+77	+19
Forest grouse bagged per 100 hours	16	-16	-44
Average hours per hunter-day (complete hunts)	4.92	+151	+70
Hours hunted per grouse bagged (complete hunts)	6.28	+3205	+47

Forest grouse per hunter increased 77 percent from 1998, and was 19 percent above the long-term average.

Sex and Age Composition of the Harvest

Sex and age composition of the harvest as determined from wings is shown in Tables 20 and 21.

Following are data derived from ruffed grouse wing surveys in 1999 compared to 1998 and the 10-year (1989-98) average:

	<u>1999</u>	Percent change from <u>1998</u>	Percent change from <u>Average</u>
Sample Size	508	+358	+252
Percent Males	--	--	--
Percent Females	--	--	--
Young per 100 adults	219	+5	0
Young per 100 hens (adult)	--	--	--

Following are data derived from blue grouse wing surveys in 1999 compared to 1998 and the 10-year (1989-98) average:

	<u>1999</u>	Percent change from <u>1998</u>	Percent change from <u>Average</u>
Sample Size	539	+269	+226
Percent Males	46	0	+2
Percent Females	54	0	-1
Young per 100 adults	117	-20	-55
Young per 100 hens (adult)	235	-11	-61

Quail

CLARK BRONSON

California Quail

Statewide harvest statistics, when compared to 1998, showed an increase in total harvest. Hunter success (birds per hunter-day) increased 5 percent and was 7 percent above average. Hunter-days afield increased 12 percent from 1998, but was 3 percent below average.

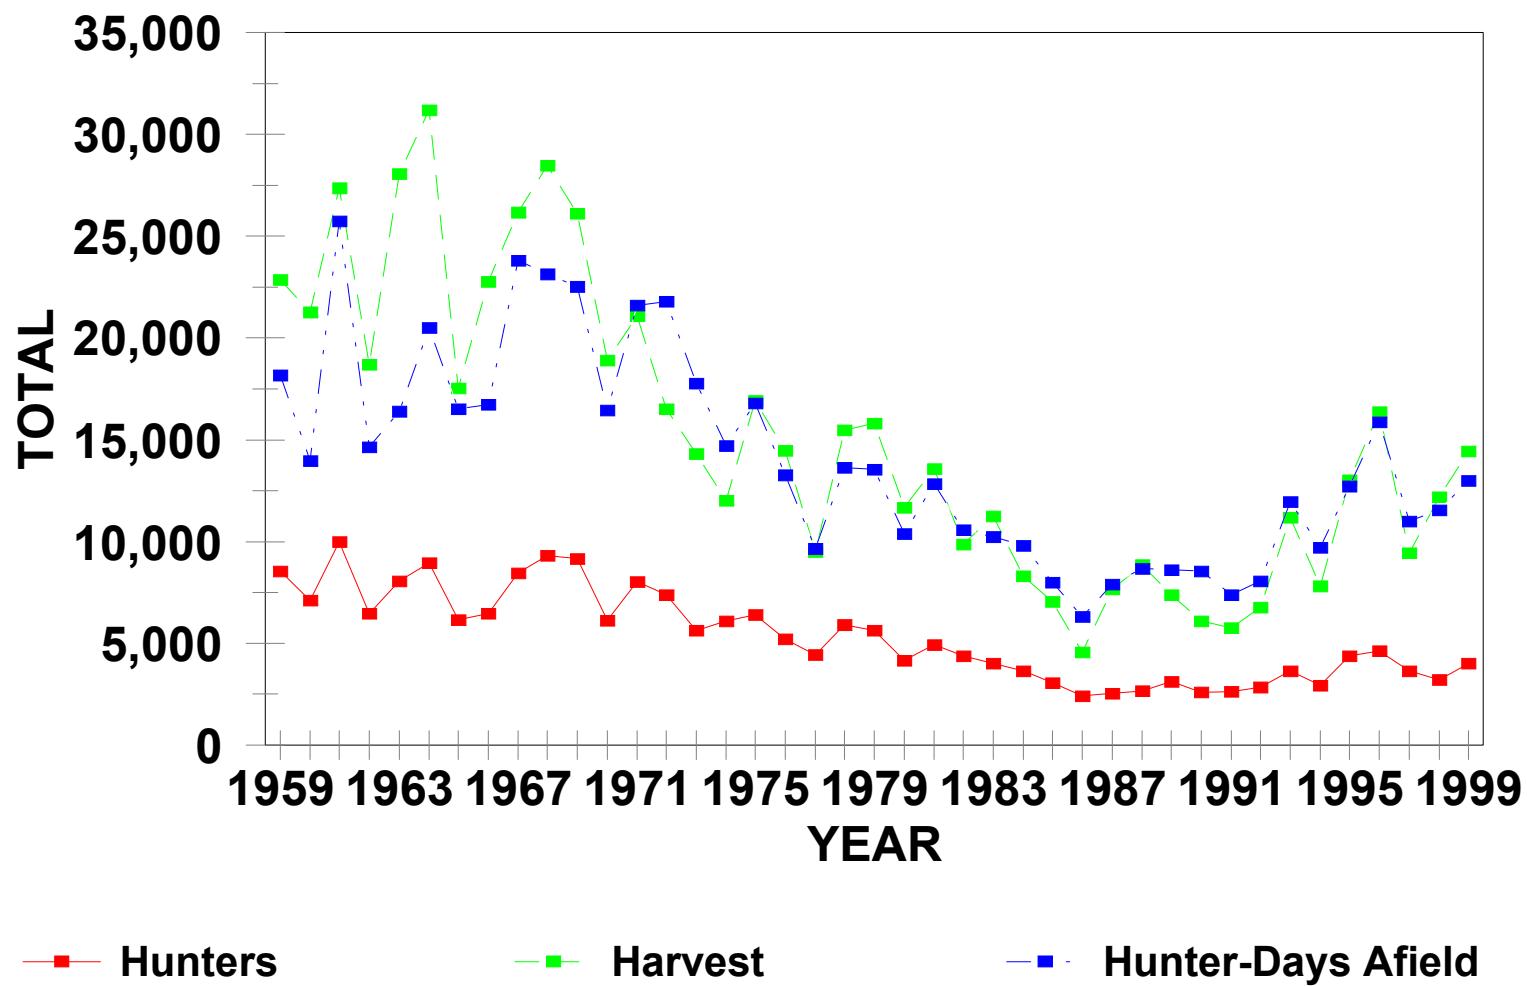

California quail are found primarily in urban areas of Utah. Hunter access to these birds is limited.

Gambel's Quail

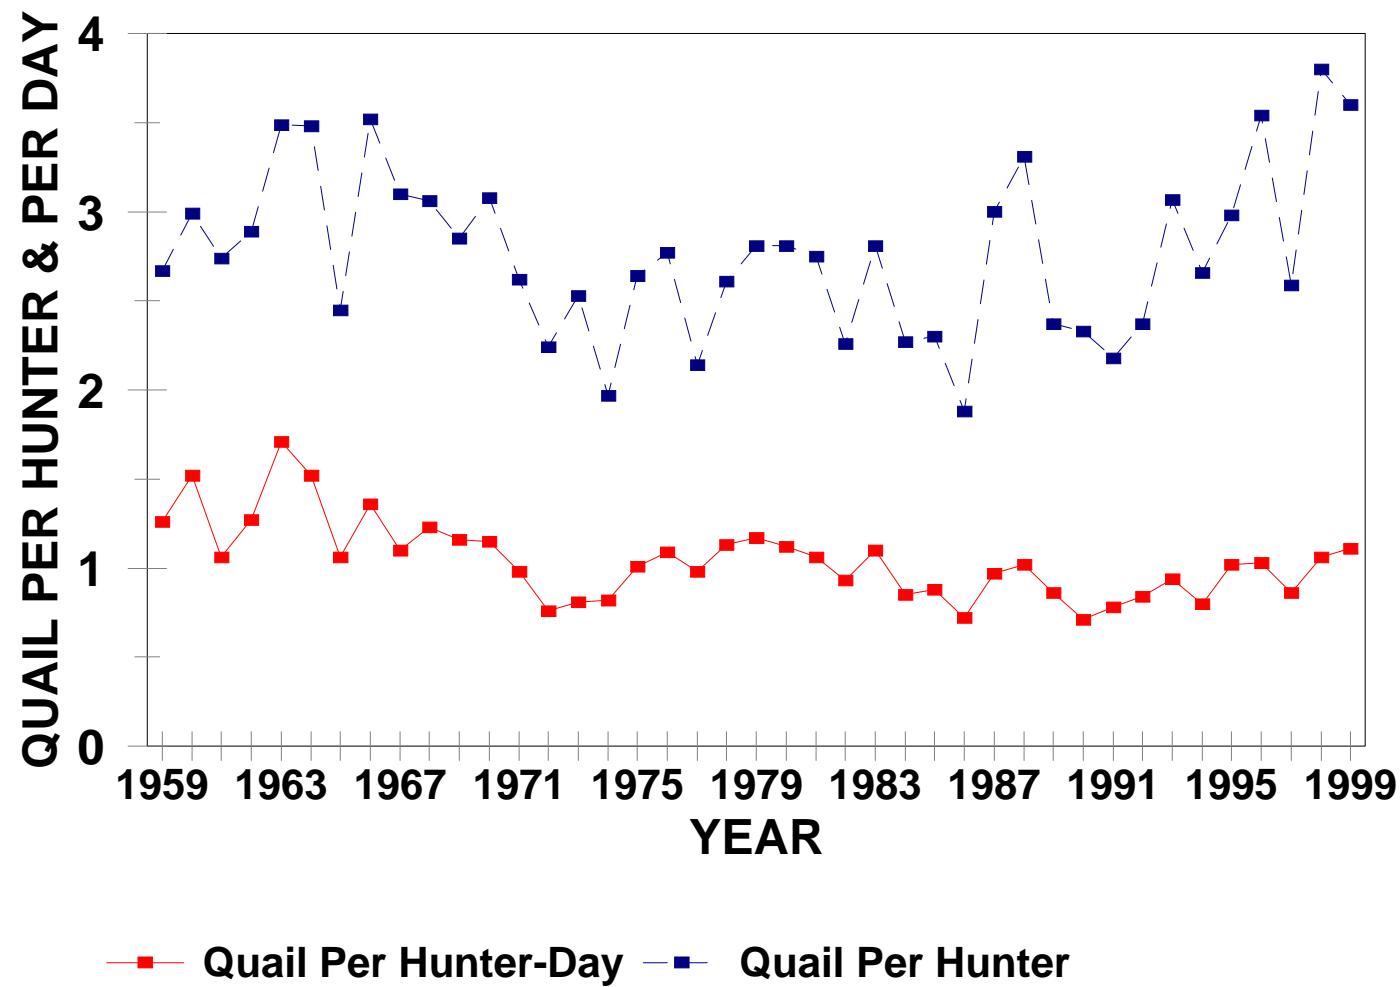

CLARK BRONSON

Figure 1. Statewide trends of quail harvest statistics, 1959-99.

**Figure 2. Statewide trends of quail
hunter success rates, 1959-99.**

Brood Counts

Results of the annual random brood counts for quail for 1999 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and quail observed per 100 hours are shown in Tables 2-4. Gambel's quail long period waterhole count trends are shown in Table 10. Survey results for 1999 compared to 1998 and the 10-year (1989-98) average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Total quail observed	148	-48	-26
Young per 100 adults	80	-83	-75
Mean brood size	2.82	-73	-62
Quail observed per 100 hours	--	--	--
Total hours effort	--	--	--

Total quail observed decreased 48 percent over 1998. Young per 100 adults decreased 83 percent over 1998.

Harvest

Results of the annual hunter questionnaire for 1999 are shown in Table 5. Long-term trends of quail bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8, and total statewide harvest statistics in Table 9.

Comparison of the 1999 season to 1998 and the 44-year average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Quail hunters	4,002	+25	-23
Quail harvested	14,422	+18	+1
Hunter-days afield	13,007	+12	-3
Quail per hunter-day	1.11	+5	+7
Quail per hunter	3.60	-5	+34

Quail hunters increased 25 percent from 1998, and remain 23 percent below the long-term average. Total quail harvest increased 18 percent from 1998.

Long-term quail harvest statistics are shown in Figures 1 and 2.

Field Bag Checks

A summary of field bag check data for 1999 is shown in Table 11. No field bag check data was collected in 1999.

CLARK BRONSON

Hungarian Partridge

The 1999 hunt data indicated dramatically increased hunting pressure on Huns when compared to 1998. The number of Huns harvested increased 237 percent in 1999. Total hunters and days afield were well above the long-term average.

We expect continued improvement in Hungarian partridge populations in Box Elder County due to the large quantity of agricultural land set aside in the Conservation Reserve Program.

Brood Counts

Results of the annual random brood counts for 1999 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and Huns observed per 100 hours are shown in Tables 2-4. Results of the survey for 1999 compared to 1998 and the 10-year (1989-98) average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Total Huns observed	--	--	--
Young per 100 adults	--	--	--
Mean brood size	--	--	--
Huns observed per 100 hours	--	--	--
Total hours effort	--	--	--

No brood count data was collected in 1999. This data is only collected opportunistically.

Harvest Hunter Questionnaire

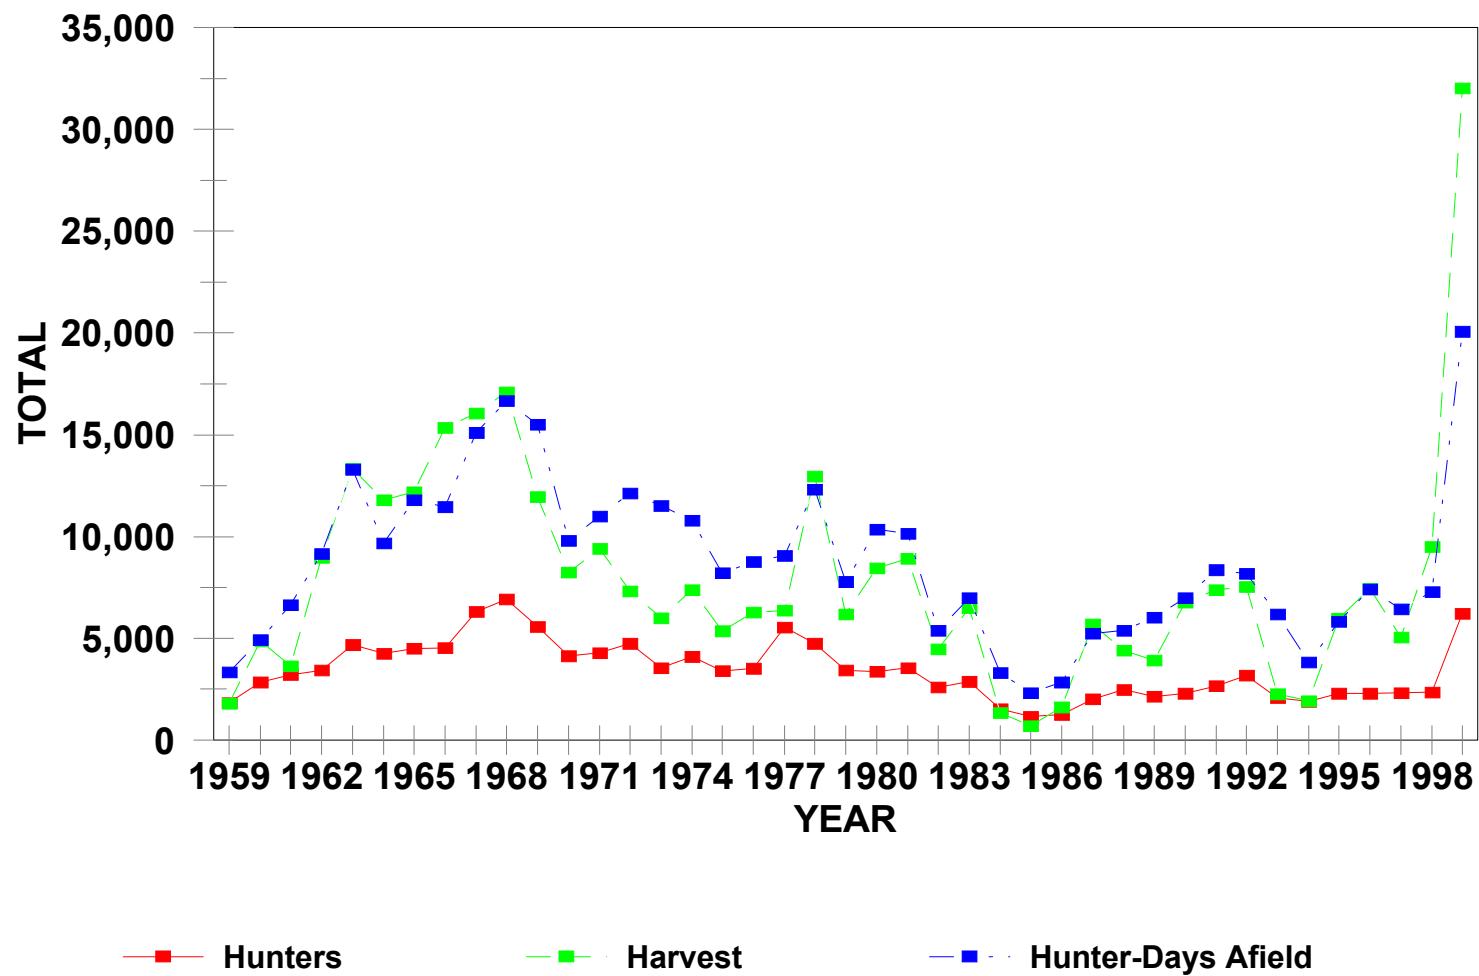

Results of the annual hunter questionnaire for 1999 are shown in Table 5. Long-term trends of Huns bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. The 1999 season compared to 1998 and the previous 40-year average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Hungarian partridge hunters	6,211	+164	+85
Hungarian partridge harvest	32,036	+237	+338
Hunter-days afield	20,063	+176	+138
Huns per hunter-day	1.60	+22	+94
Huns per hunter	5.16	+27	+145

Hungarian partridge hunters and hunting pressure increased in 1999. Total Huns harvested increased 237 percent from 1998. Harvest was 338 percent above the long-term average.

Long-term Hun harvest statistics are shown in Figures 1 and 2.

Figure 1. Statewide trends of Hun harvest statistics, 1959-99.

**Figure 2. Statewide trends of Hun
hunter success rates, 1959-99.**

In 1994, the entire state went to limited entry turkey hunting for both the Merriam's and Rio Grande sub-species. Drawing success for each of the 1999 hunts is shown in Table 6.

Merriam's Turkeys

Merriam's turkey populations remain stable. A total of 358 permits were sold. A fall turkey hunting season was not held in Utah in 1998. A total of 95 Merriam's turkeys were harvested in 1998. Merriam's turkey hunters experienced a 31 percent success rate.

Rio Grande Turkeys

Two hundred sixty-three permits were sold in 1998. A total of 161 Rio Grande turkeys were harvested in 1998 for a success rate of 63 percent.

Conservation Permits

Beginning in 1997, Sealed-bid and Auction Turkey Permits were replaced by Conservation Permits. Under the new Conservation and Sportsman Permits Rule (R657-41), wildlife conservation organizations obtain permits, authorized by the Utah Wildlife Board, and use them in fund-raising activities to generate management funds for each species. Qualified wildlife conservation organizations typically keep 10 percent of funds generated for marketing, etc. Organizations, in some cases, can keep more than 10 percent of funds generated from permits if they propose habitat or management projects to benefit the species.

In 1999, the statewide turkey conservation permit was issued to the Utah Chapter National Wild Turkey Federation. The statewide turkey conservation permit allows the holder to hunt over an extended season on any open turkey unit in the state. In 1999, the statewide turkey conservation permit sold for \$1,194.50.

In 1999, nineteen area turkey conservation permits were issued to the Utah Chapter National Wild Turkey Federation and Sportsmen for Habitat. An area turkey conservation permit allows the holder to hunt over an extended season on one or a combination of open turkey units. In 1999, the area turkey conservation permits generated \$9,962.00.

Total turkey conservation permits funds generated in 1999 was \$11,156.50.

Harvest

Spring Merriam's Gobbler Season

Results of the 1999 spring season are shown in Table 1 of this section. The trend of these data since 1968 is shown in Table 2 and Figures 1 and 2. Statewide summary of fall hunt statistics is in Table 3. The 1999 spring season survey compared to 1998 and the previous 31-year average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Permits sold	355	-1	+27
Hunters afield	327	+6	+30
Turkeys harvested	111	+17	+198
Hunter-days afield	1,188	-2	+48
Percent hunter success	34	+10	+157
Turkeys bagged per hunter-day	0.09	+12	+94
Percent of hunters who observed turkeys	84	+367	+98

Total harvest increased 17 percent from 1998. Hunter success rates increased 10 percent and was 157 percent above the long-term average.

Spring Rio Grande Gobbler Season

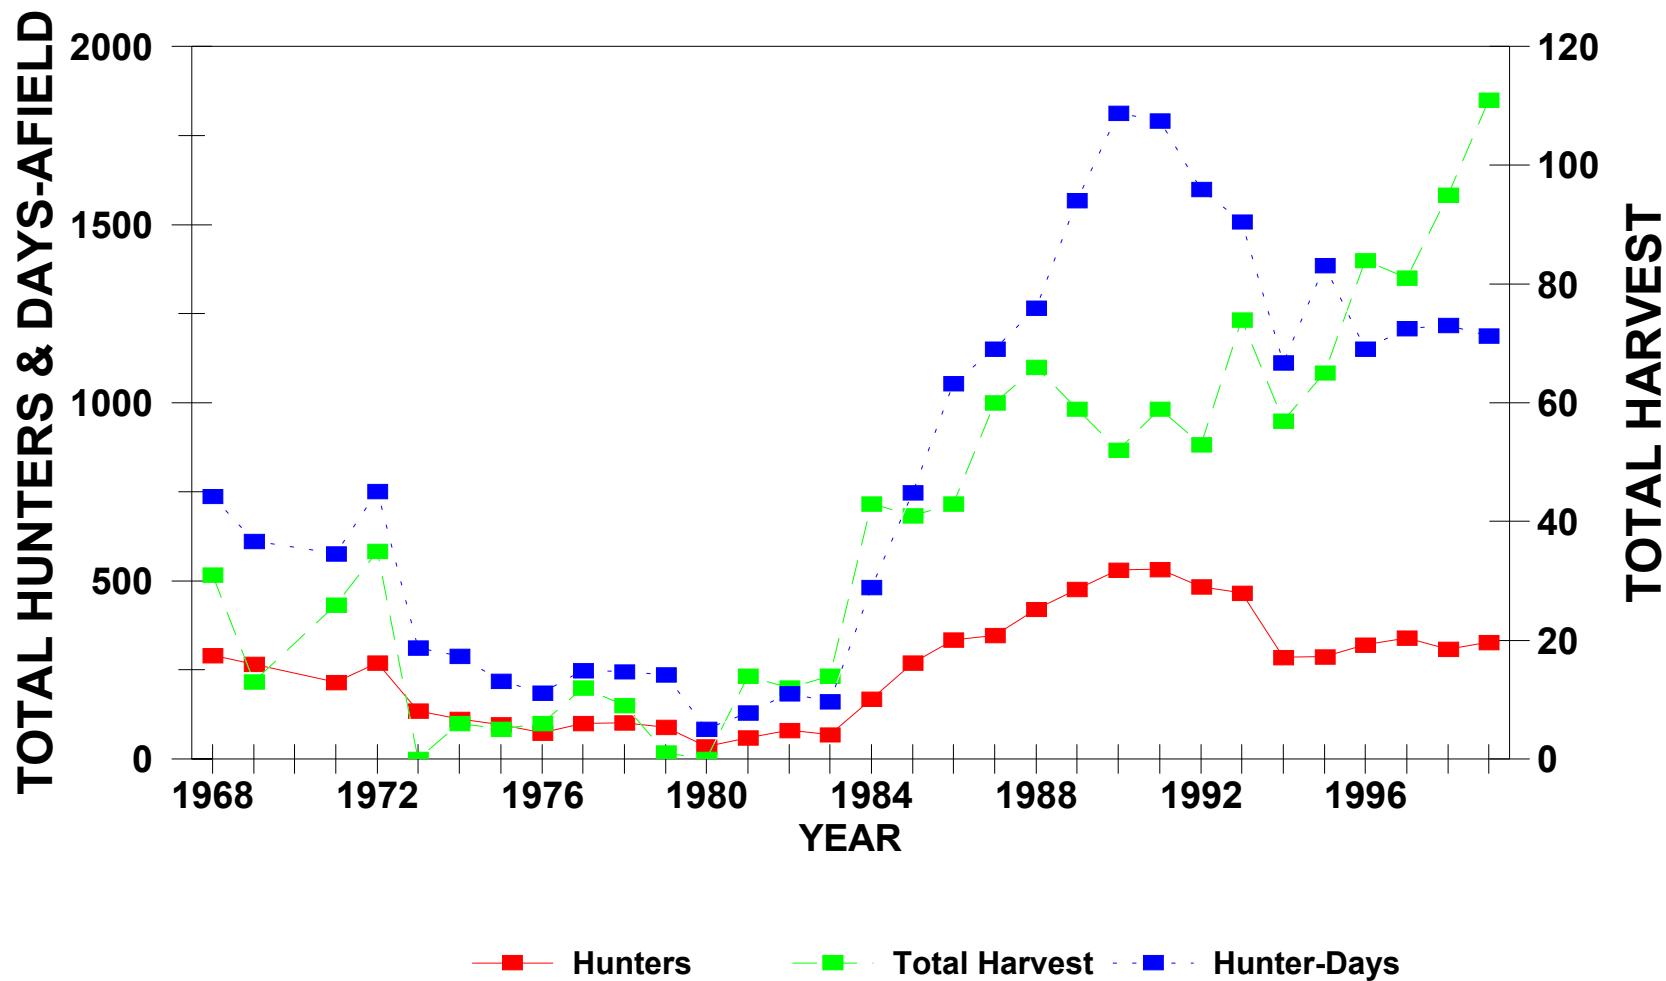

Results of the 1999 spring season are shown in Table 4 of this section. The trend of these data since 1991 is shown in Table 5. The 1999 spring season compared to 1998 and the previous 8-year average follows:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Permits sold	398	+51	+218
Hunters afield	413	+63	+246
Turkeys harvested	289	+80	+283
Hunter-days afield	1,373	+49	+172
Percent hunter success	70	+11	+8
Turkeys bagged per hunter-day	0.21	+17	+32
Percent of hunters who observed turkeys	90	+58	+19

Four hundred thirteen hunters harvested a total of 289 turkeys. Seventy percent of the hunters afield harvested a bird.

As other Rio Grande populations continue to grow throughout the state, more hunting opportunities will be provided.

*Some hunters hunted more than one area or failed to designate areas hunted. This accounts for the difference between totals given above and combined tables of separate units in Tables 5, 6 and 7.

**During 1968, the Boulder Mountain and East Zion units had two-bird season limits and the LaSal Mountains a one-bird limit; from 1969 through 1972, all areas had a two-bird limit. Hunter success was based on the number of successful hunters rather than total turkeys bagged.

*** No fall season.

CARL BRUNSON

Sharp-tailed Grouse

The Columbian sharp-tailed grouse is one of four species of grouse native to Utah. Sharptails were formerly abundant in the valley and foothill areas of northern and central Utah. Sharp-tailed grouse habitats were the most attractive areas for agricultural development and grazing. As a result, sharptail habitat was directly converted to farmland or was seriously impacted by heavy grazing.

Annual lek count survey data from 1979-99 is found in Table 1.

There was no legal harvest of sharp-tailed grouse from 1980 through 1997.

In 1998, as a result of intensive lek location surveys conducted in 1997 and 1998, a conservative, limited entry hunting season was offered. The hunt occurred in eastern Box Elder County in Northern Utah. The hunt strategy was designed to allow for the take of no more than 10-15 percent of the total fall population of sharptails. In 1999, a total of 663 two-bird permits were offered through a drawing and first come-first served after the drawing. A total of 381 permits were sold. Three hundred thirty-two hunters went afield and harvested 413 sharptails. Harvest statistics for 1998-99 are found in Table 3.

In Box Elder County, habitat associated with existing populations of sharp-tailed grouse has been relatively unchanged since 1983 except that about 100,000 acres in Box Elder County have been entered into the Conservation Reserve Program (CRP). This may be benefitting sharp-tailed grouse populations by providing undisturbed nesting and brood-rearing cover.

Sharp-tailed grouse brood count information for Box Elder County in 1999 is shown in Table 2.

Table 1. Lek counts of Columbian Sharp-tailed Grouse in Utah.

White-tailed Ptarmigan

The white-tailed ptarmigan (*Lagopus leucurus*) was introduced into the Uinta Mountains of northeastern Utah in 1976 with the release of birds captured in Colorado. The initial transplant consisted of 22 paired birds released in June 1976. A second release of 35 mixed young and adults was accomplished in September of that same year.

Since introduction in 1976, ptarmigan have dispersed into available habitat from the west, 100 miles to the east in the Uinta Mountains.

Breeding Territory and Brood Surveys

Surveys on the ptarmigan population continue, but only as time and manpower constraints allow. Two survey techniques are used. A breeding territory survey is conducted from mid- to late June. A brood survey is conducted from mid- to late August. Results of the last 10 years of survey data are found in Tables 1 and 2.

These surveys have not been conducted over the past several years due to the remoteness of ptarmigan habitat and other constraints on biologist's time.

Harvest

Ninety hunters obtained free permits to hunt ptarmigan in Utah in 1999 (Table 3). An estimated 34 hunters actually pursued ptarmigan and 23 birds were killed.

Many permits are obtained by sportsmen who think they might hunt during a fishing or big game hunting trip, but don't seriously plan on the ptarmigan hunt.

Results of the 1999 season are shown in Table 3 of this section. The trend of these data since 1982 is shown in Table 3 and Figures 1 and 2. The 1999 season compared to 1998 and the previous 17-year average follows:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>

27% QUESTIONNAIRE RETURN RATE

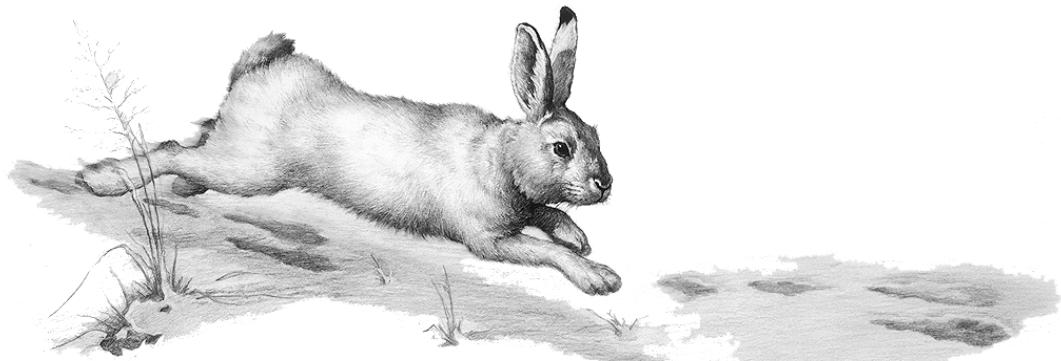

Rabbits and Hares

Cottontail Rabbit

Summer roadside counts indicated an increased population density statewide, but reproduction was below 1998. Harvest statistics indicated increased hunter success, but is still 16 percent below average.

Snowshoe Hare

Hunter numbers increased 96 percent from the previous year, but remained below average. Total hares harvested increased 103 percent from 1998.

COTTONTAIL RABBIT

Roadside Counts

Results of the annual roadside counts for 1999 are shown in Table 1 and Figure 1. The long-term trend of cottontails observed per mile and young per 100 adults is shown in Tables 2 and 3. Indices for 1999 compared to 1998 and the 10-year (1989-98) average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Total miles driven	1,639	+17	+137
Total cottontails counted	442	+26	+117
Cottontails observed per mile	0.27	+8	-10
Young observed per 100 adults	79	-10	0

Production data from roadside counts indicated an increase in the total statewide cottontail population. Cottontails observed per mile increased 8 percent from 1998. The cottontail young per 100 adults index decreased 10 percent from 1998, but was unchanged from the long-term average.

Harvest

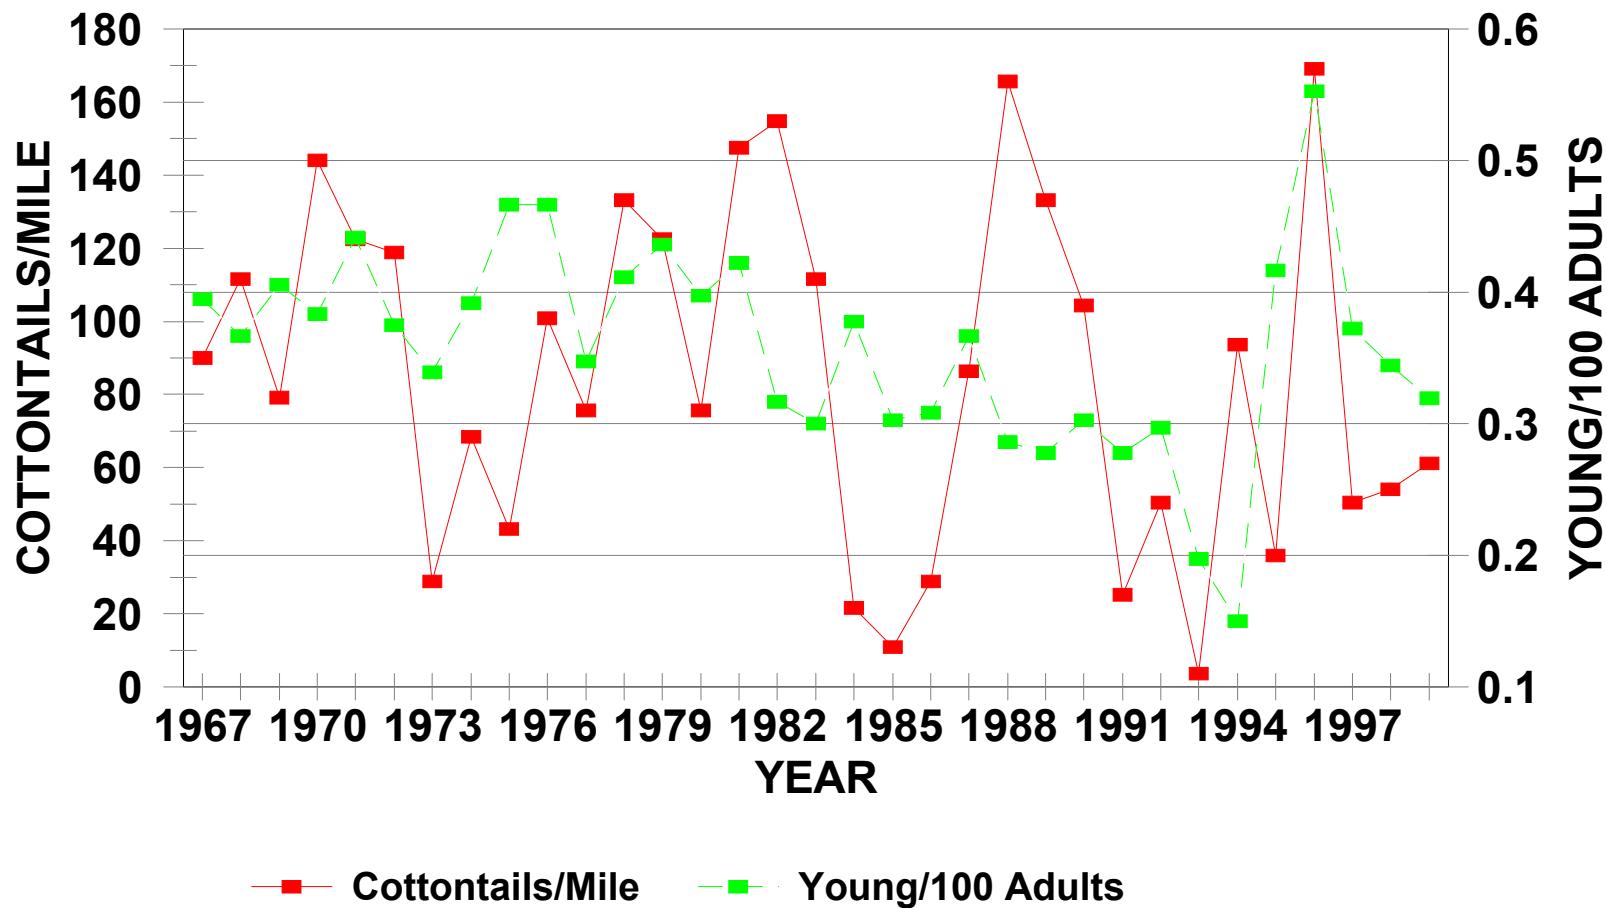

Hunter Questionnaire

Results of the 1999 hunter questionnaire are found in Table 4. Trends of cottontails bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 5-7. Trends of statewide harvest statistics are found in Table 8 and Figures 2 and 3. Results of the 1999 season compared to 1998 and the previous 32-year average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Cottontail hunters	15,475	+46	-31
Cottontail harvest	66,142	+16	-53
Hunter-days afield	54,894	+19	-41
Cottontails per hunter-day	1.20	-3	-16
Cottontails per hunter	4.27	-21	-27

Total hunters increased 46 percent from 1998. Total harvest increased 16 percent. Total harvest was 53 percent below average. Hunter success was 16 percent below average.

SNOWSHOE HARE

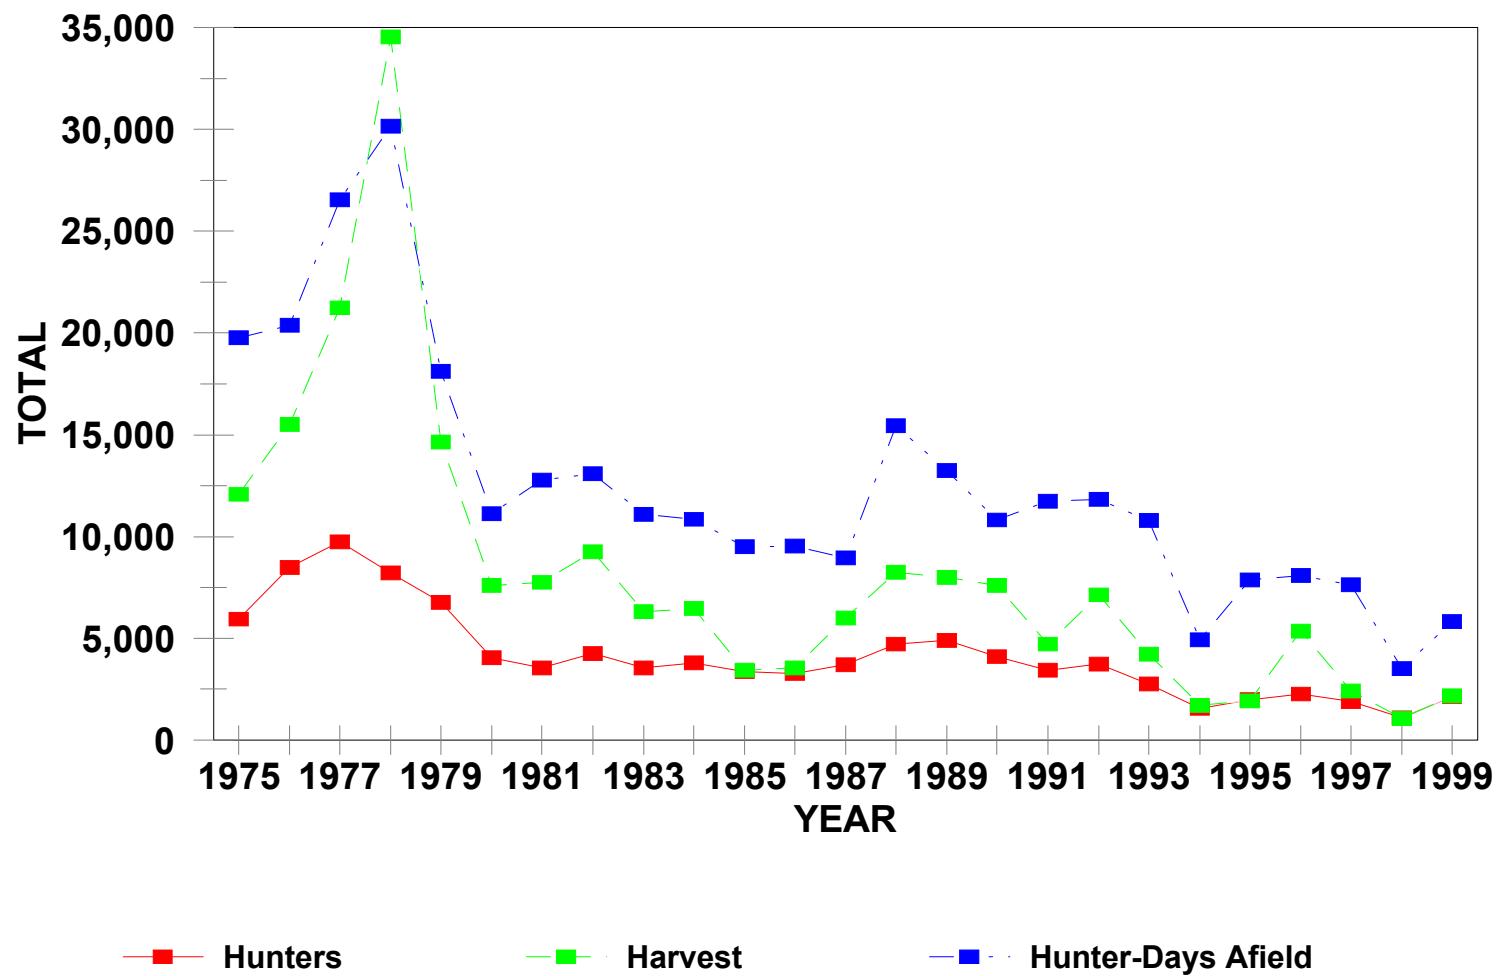

Harvest

Results of the 1999 hunter questionnaire are found in Table 11. Trends of snowshoe hares bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) are found in Tables 12-14. Trend in statewide harvest statistics by year are shown in Table 15 and Figures 1 and 2. The 1999 season compared to 1998 and the previous 24-year average follow:

	<u>1999</u>	<u>Percent change from 1998</u>	<u>Percent change from Average</u>
Snowshoe hare hunters	2,139	+96	-49
Snowshoe hares harvested	2,173	+103	-74
Hunter-days afield	5,831	+65	-55
Snowshoes per hunter-day	0.37	+23	-36
Snowshoes per hunter	1.02	+4	-43

Results of the 1999 harvest questionnaire indicates a 103 percent increase in total hares harvested. Success was 36 percent below the long-term average.

**Figure 1. Statewide trends of snowshoe
hare harvest statistics, 1975-99.**

**Figure 2. Statewide trends of snowshoe
hare hunter success rates, 1975-99.**

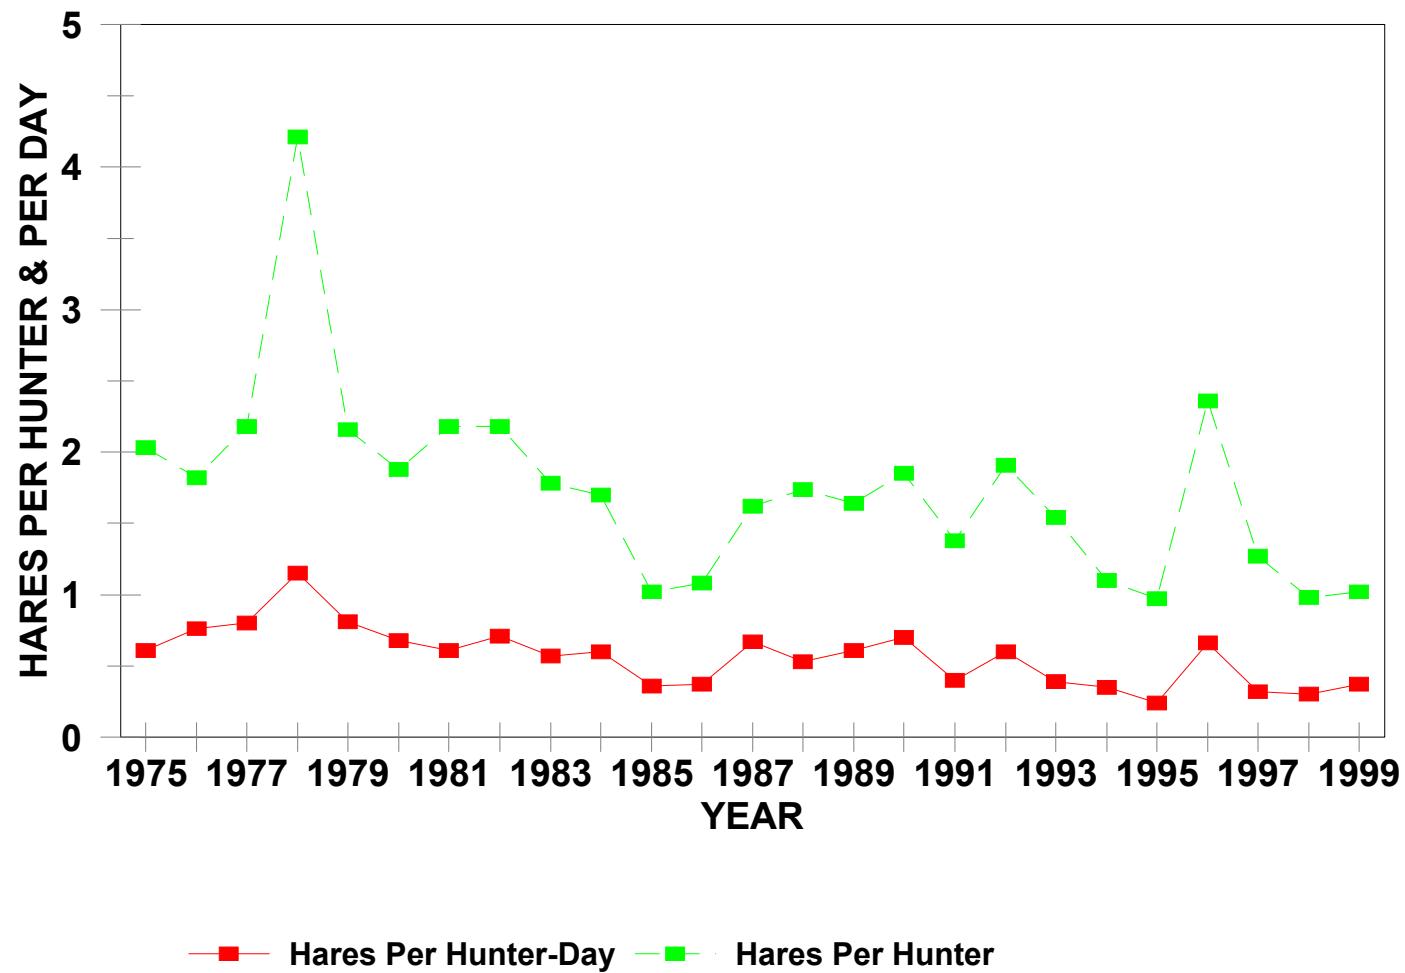

Table 11. Summary of snowshoe hare hunter success and distribution of harvest and hunting pressure by region and county, 1999.

APPENDIX A

WEATHER CONDITIONS

Weather information used in this report (Tables 1 & 2 and Figures 1 & 2) is from the N.O.A.A. monthly periodical titled "Climatological Data."

The 1998-99 winter weather was very mild in terms of temperature. During November-March temperatures statewide were well above normal. Below average precipitation fell November through March.

In the spring of 1999, temperatures were below normal April through June. Precipitation was above normal April through August.

Table 1. Comparison of 1999 monthly average temperatures (F) to the normal for each weather division and statewide.

APPENDIX B

LICENSE SALES

Small game and Combination license sales by type and cost are listed in Table 1. The number of licenses sold for all types increased slightly in 1999.

The proportion of Utah's population hunting small game is declining (Table 2). In the early 1970s about 9 percent of Utah's population was hunting small game. In 1999, only 2.9 percent of Utah's population hunted small game.

Table 3 identifies revenue generated to the Utah Division of Wildlife Resources from small game license sales. Small game program budgets run about half the revenue generated, with the other half going to support services such as law enforcement, administration, accounting, and public services.

Table 1. Statewide small game license sales information, 1954-99.

Year	Adult Res.		Juv. Res.		Non Res.		Combination License

1 Value does not include cougar, bear or wild turkey permits, habitat authorization, or cooperative wildlife management unit or commercial hunting area license fees.

It does not include NRSG revenue--this is assumed to be primarily non-resident bear and cougar hunters.

2 Combination license values are based on the assumption that all waterfowl hunters purchased only combination licenses. They may fish and hunt big game but they do not hunt any other small game. Therefore, duck stamp sales are subtracted from combination license sales when projecting revenue generated. The proportion of the combination license fee attributed to small game equals the resident small game license fee divided by the resident fishing license fee, plus the resident small game license fee.

3 Total Federal duck stamps sold does not include those sold during the second quarter, April-June, because persons purchasing stamps during this quarter tend not to be hunters.

4 Half of the juvenile small game license sales were attributed to waterfowl hunters. Federal duck stamps are not required of juveniles less than 16 years of age.

APPENDIX C

Surveys

Regional and statewide summary of effort expended on upland game summer surveys, 1972-99 is found in Table 1.

Generally hours spent and miles driven on upland game surveys in Utah have declined dramatically since 1972. This is the result of competing uses of time for biologists and conservation officers. In addition, the restriction to a 40 hour work week by the Federal Fair Labor and Standards Act has further eroded survey effort. When effort and results have reached a lower critical sample size, surveys have not been conducted or little effort expended.

Table 1. Regional and statewide summary of effort expended on upland game summer inventory, 1972-99.
