“Finding out how many there are left is the least of the purposes of game census.

Measuring the response of game populations to changes – deliberate or accidental – in their environment is the big purpose.

Continuous census is the yardstick of success or failure in conservation.”

INTRODUCTION

The objective of Utah's upland game management program is to provide recreational hunting opportunity for sportsmen within the limits of the annual harvestable surplus for each species. It is based on the knowledge that populations of upland game experience relatively high rates of annual turnover. High reproductive rates are naturally compensated for by high rates of mortality, whether hunting is allowed or not. Annual surveys are conducted to measure the production, trend, and harvest of each upland game population.

This is the 35th Annual Upland Game Report. It is an annual performance report of information compiled during inventory and harvest surveys conducted under Federal Aid Project W-65-M, segments 56 & 57. Information contained herein was collected and compiled by biologists, conservation officers, wildlife managers, and upland game management staff of the Utah Division of Wildlife Resources. This report covers the 2008–2009 upland game season and 2008 turkey season.

This report serves as a handbook of inventory and harvest data. It is designed primarily for the use of those concerned with the management of upland game. A separate section is devoted to each species of upland game in Utah. Data are presented primarily in tabular form with limited figures.

The upland game harvest survey is designed to monitor statewide harvest trends from year to year. The more extensively a species is hunted, the more accurately the survey measures the trend data. To improve the accuracy of the indices for species that receive very little hunting pressure, have low densities, and a limited distribution, a unique survey is used. Each species of that type must be hunted using a special permit so that hunter information can be obtained for survey purposes. Species falling into this category include band-tailed pigeon, sage-grouse, sharp-tailed Grouse, white-tailed ptarmigan, and wild turkey.

The annual harvest report is sometimes criticized for being inaccurate and without value. However, report users must recognize that the accuracy of the survey is based on 4 basic assumptions: (1) the survey sample is completely random; (2) respondents clearly understood the question; (3) respondents recorded or remembered data accurately, and did not guess or lie; and (4) respondents correctly identified the species hunted. If those assumptions are not met, projections or harvest by county may be over-estimated due to non-response or memory biases. Extreme caution should be used in the interpretation of estimated harvest and hunters for specific species in specific counties. Rather, the long-term trend in these indices should be used in managing the populations.

Presently, the Upland Game Annual Report contains the best data available and therefore constitutes the basic facts of upland game management. Although this report has its limitations, the trend data is valuable in making professional judgments regarding upland game populations and harvest.

The annual report is used in wildlife planning. It can be used to establish relative importance among species and for developing new resources through transplants or habitat developments. It

points out areas of needed research by indicating problems and possible causes. It documents population trends and it combines all this inventory information into one easily accessible publication. Thus it is used extensively by federal land management agencies in environmental impact statements and management plans. It will become increasingly more important in developing management plans and assessing impacts on wildlife habitat.

METHODS

Upland Game Harvest Surveys

General upland game harvest statistics were obtained from a random sample of licensed hunters using an Internet-based survey, followed by a telephone survey for non-response bias. The sample was stratified by license type and then the data were projected by the total number of license holders in each stratum. Hunters with permits for band-tailed pigeon, sage-grouse, sharp-tailed grouse, white-tailed ptarmigan, and wild turkey, were surveyed through a separate telephone survey. Online harvest reporting was mandatory for all hunters who obtained a sandhill crane permit, regardless of success. Several hunters failed to report so harvest statistics are projected by the total number of permit holders for each individual hunt.

As of July 1, 2007, the 365-day small game license was renamed a basic hunting license and all hunters were required to purchase either a valid combination license or a basic hunting license before purchasing a species-specific hunting permit in Utah or before applying in any drawings. The number of licenses sold has more than doubled as a result of this change, and a much larger sample of license holders was required for the upland game harvest survey.

37,758 people were randomly selected for participation in the general upland game harvest survey, representing a 20.7% sample of all licensed hunters in Utah for 2008. These hunters were sent an email inviting them to participate in the Internet-based harvest survey. Of those hunters contacted, 11,231 (29.7%) submitted an online harvest survey. A random sample of 3,093 hunters who did not respond to the Internet-based survey were contacted by telephone for the non-response bias survey.

A total of 37,419 hunters spent 302,019 days afield in pursuit of various upland game species in 2008, with the harvest totaling 279,591 animals. Detailed information describing the upland game harvest can be found in the following tables. Regulations for the 2008 upland game hunting season are shown in Appendix C.

*White-tailed ptarmigan are only found in high elevation areas in Daggett, Duchesne, Summit, and Uintah counties; however, some hunters reported having hunted ptarmigan in other counties.

**Statewide totals for sample size and hunters afield are not the total of the columns because hunters hunted multiple counties. Projection factor = 3.80; 304 permits sold; 80 (26%) permit holders surveyed.

***In 2008, turkey hunters were no longer restricted to taking only one species (Rio Grande or Merriam's), so turkey harvest statistics beginning in 2008 are no longer split out into separate tables by species. Historical Merriam's and Rio Grand turkey data have been combined into the table above, and percent success and turkeys/hunter-day recalculated.
